Hi, I just spotted a TS-830S for sale at Burghardts Web Site.

http://www.burghardt-amateur.com/Burghardt/HTML/main_frame.html
LAST UPDATED - 7/26/06
KENWOOD TS-830S 160-10, 125W, VBT, NOTCH, AC Rg $399.00

I have no connection with this company. Nothing to do with the sale of this radio. Just want to help someone find a TS-830S.

I have 2 of them. Good Luck.

Bob N3DOK

Here are some thoughts on making a substitute L41 antenna input transformer. The circuit for 160 meters has a low frequency limit of 1.5MHz,if it is consistent with all the other coil notations on the schematic. The actual secondary resonant circuit in this position is the secondary inductance in parallel with 500pF total and loaded by a 10K resistor. I get the C total by adding up all the switched in caps including the caps on S1-3. The cap "L" in the schematic I have estimated to be 120pf fully meshed. It might be more than this but certainly not more than 200pf, but let's use 120 as a starting point for discussion.

That means that the secondary L is about 212uH for resonance, if I did my math right. Powdered iron does not have the permeability to make this inductance with 26 turns, so looking through my info on ferrites, I find that and FT37-43 might give a little too much inductance but two parallel FT23-43 cores should be pretty close. For those who want to check my math, etc., the Al value of FT37-43 cores is 420mH/1000T and for FT23-43 cores is 188mH/1000T. We need about 313mH/1000T to get the right inductance with 26 turns. We can adjust down the number of turns a little if needed to tweek it in.

Now, to try winding a coil given these parameters.

Someone please check my numbers and see if I am off base.

Thanks.

I will take a look at forms that are available that will fit the holes in
the PC board, hopefully.

hi,

I have the shield on my ts-520
but my ts-530 has no shield.

did the 530S have a tube shield
for the driver tube ?

hallo bob
Charles returning
you are dead right there I have just downloaded the manual and had a bit of
a gander at the vfodo you have a better exploded view of the dial system
how much movement is there on the dial the way I see it at the moment it is
a small engineering job this one is not an easy fix on the 830 the 820 is
a simple job one suggestion I have is to find an outboard vfo a non
working unit and cannibalize the parts or swap the vfo over in to yours the
thing is that will cost money but either way you go about the fix problem it
will cost until I can find a better picture of the make up how things go
together the biggest problem is that spring and two washers that holds the
sub dial in position if it wasn't for that spring I could suggest a fix
sorry I cant help you much more than that when I get some better pictures
then I will see if I can find a way around the situation

8395. Meter Readings

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-07-27 13:36:54 UTC
From: Max Harelik
Topic: 8395 Message: 8395

I have two TS-530S's sitting side-by-side. Both put out ~100w. They have about the same peak driver reading in tune, but very different for plate and load. One 530, when plate and load are adjusted, peaks just a few mils, the other 530 peaks well up on the scale.('Carrier' control effect is taken into consideration.) Again, both radios put out ~100w.

My question is this: Is this just a meter driver issue (that perhaps may be remedied by adjusting VR11?), or should I be looking elsewhere? I don't know enough about the innards of this radio to chance random twiddling, and I'm not equiped to do proper maintenance. Any help will be appreciated. Thanks.

Max,

The voltage across the cathode resistors R2 to R5 (all in parallel) is what is measured by the meter, via R6 and R10, when the PA current on the meter switch is selected. If both rigs are giving 100W output, then the PA stages of both rigs must be OK, so I suspect R6 (2K7) may be faulty, or possibly R10. If the meter reads the HV correctly (about 800V), then it is not a meter fault..

The PA current for 100W output should be around 250mA

Don't adjust the standing PA current potentiometer until you are getting a correct reading on the meter when warming up you power meter load. Then set it for 60mA.

Also, take care working in this part of the rig due to the lethal voltages.

Richard G3OTK

Contact Vintage Manuals. They may have original in stock. As far as having a hard time reading the schematics, I have enlarged them on my printer/copier. If you go to a Office Max type store, they can enlarge it. I have done this in the past. Down load the material on a disk or cd. They can work from that also.

Is your meter switch in the RF position or IC position ?
If it is in the RF position you are not reading IC but are reading relative RF output. Set this with VR-10, not 11 so it reads 3/4 scale with full output.
If this is occurring in the IC position, you may have problems with the cathode resistors as Richard Harris suggested. Check to see if someone may have bypassed them after they opened, a very bad thing to do. If this has happened, they will need to be replaced.

Subject: [TS-520_820_530_830] Meter Readings

I have two TS-530S's sitting side-by-side. Both put out ~100w. They have about the same peak driver reading in tune, but very different for plate and load. One 530, when plate and load are adjusted, peaks just a few mils, the other 530 peaks well up on the scale.('Carrier' control effect is taken into consideration.) Again, both radios put out ~100w.

My question is this: Is this just a meter driver issue (that perhaps may be remedied by adjusting VR11?), or should I be looking elsewhere? I don't know enough about the innards of this radio to chance random twiddling, and I'm not equipped to do proper maintenance. Any help will be appreciated. Thanks.

Richard & Walt,

I didn't specify RF or IC, did I? I meant RF. I found VR11 (VR10 is Anti-Vox in my destruction manual) on the schematic, but was unable to locate it on the radio.

Turns out that the service manual just calls it "RF Meter Pot." and shows it (of course) on the rear panel (Adjustments, p. 41, #22). Lo and behold, there it was, and I now have sufficient indication on the earlier-stingy meter.

I had been concerned that there were more serious problems when, during the course of repairing the tank bandswitch coupling, I found all four screen bias resistors (R2,3,4 & 5) smoked. Wonder it worked at all. Replaced those. Radio's fine, now.

Thank you, gentlemen, for permitting me to learn something today.

Topic: 8370 Message: 8403

Hi all,

I just got my Technician license a few months ago and since then, I've picked up a few military radios to play with on 6M and 29.6 Mhz FM.

Here's a picture of the "shack":
http://i4.photobucket.com/albums/y126/von_landstuhl/shack.jpg

I'm looking to get an HF rig and a co-worker has suggested the TS-830S. I already know not to pay more for the Gold Edition, so we don't have to go there. I want to work with Army MARS someday and would like to confirm something I read. Is it true the TS-830S can work outside the ham bands by installing a crystal in the bottom and pushing in the FIX button? If so, does this allow a range of frequencies or just the one freq?

It seems prices run around $400 on eBay, but I'm reluctant to spend that much money there because I don't want to get burned. Are there any reputable shops that tend to have them in stock?

Is there anything I should know before buying?

Thanks,
Joe

Joe,

Very unusial station. I like it! I have a R-391 Receiver and I'm looking for a quality military transmitter to pair up with it. It will complement my TS-520ES. I don't have much military gear, but I like it and plan on getting more in the future.

Best,
DW Holtman

Hi Joe,

I remember you from the Yahoo Armyradios group. Since most Mars freqs. are relatively close to the HF ham bands, yes more than likely all you'd need to do is add crystals in the fixed channels, and do the usual tuning procedure these rigs require. Walt, and Bill can probably answer this better than me.

By the way, you, mentioned having milradios for operating on 6m, and 29.6 MHz (10m) FM. Are you working to upgrade to General? Because while you can operate on 6m FM as a Tech, even as a Tech with HF priveleges (which requires passing the 5 WPM code test, giving you the same priveleges as the old Tech Plus license), you cannot operate on 10m FM (although you can operate 10m SSB from 28.3 to 28.5 MHz, and CW in the old HF Novice bands). For 10m FM, you need to be a General or higher class licensee.

73,
Ellen - AF9J

I'm not working on General yet, so right now, I just listen. I debated clarifying that I don't transmit, but I figured you guys would know that I'm not allowed there. ;)

Last time I worked a guy on one of those green radios, it was actually in a tank!

1970s, on 29.600, heard someone going "Hello, test, test..." and a funny callsign.. I answered him, and he was at some Army or Army Guard base in the Southeast, working on a tank radio! Not a ham, but hey I will talk to military ops if they come up on frequency. Anyway we had a real nice, but short conversation; he told me that the only activity they ever heard on their radios was on this frequency and they were hams and it was fun listening to us, and he wondered if that was legal or not! Talk about the pot callin' the kettle black; anyway I 'splained to him what wazzup with 29.6, and invited him to contact me about getting a ham ticket! Never heard from him again but I hope I planted the seed!

Can someone please recommend someone that really knows Kenwood Rigs. I sent out my TS830S because of a no TX problem and now the tech? claims that he can't fix it because he doesn't have a sweep generator. Person also claimed
that someone had "fiddled' around as he put it with the slugs. Not true, I've had that rig for at least 15 years and never
had I touched anything inside the rig other than changing the finals. So I've wasted money shipping the rig to him and now
he wants some cash for the work the he claims he did but I still don't have a working rig???? Out of respect for him I won't disclose his name or call, but never will I recommend. Anyway I don't want to lose the rig but I need someone that is competent
and has the proper equipment for making repairs. It's been 3 months (at least) maybe more of waiting and now nothing.

Thanks Gordon for the reply. As you can see I'm pretty upset about
the whole deal. Guess you can't go by pretty web sites that some
people put together (it was quite impressive). Well anyway Bill
if you see this post please contact me if you don't mind. I'd like
to get my 830 working again. What gets me is the first email I got
from this person he said " yes Ruben this ones a keeper" guess that
should have been the tip off but I gave him the benefit of the
doubt. And I agree if I sent it in for repair and he's not returning
it in PROPER working condition then I should not have to pay. I sent
it in good faith with the expectation that it would be repaired by
what I thought and believed was a competent tech and am not getting
that in return. Thanks guys for listening...Ruben 73 fer now...
Let's see how this soap opera ends....

Ruben,
Check with Bill right here on this Group. He is the Owner.
I repair 830's and 820's but mostly just for myself. Once I have them
all aligned and cleaned, I then re-sell them and buy others.
If the Tech didn't have the Equipment to fix it, He should send it
back to you with NO charge and with a full refund on your shipping
also. (IMHO)

Check out the service manual - you need a sweep generator to do a full alignment on these radios. If I remember right, it needs to go up to around 35mhz and you adjust a few coils to get a passband response curve to the correct shape.

I forget which board gets the adjustments and I don't know if that's even needed for a TX issue.

I think the shop should invest a few hundred bucks in a sweep generator so they can do the job right, or send it back to you at no change.

Ok Dave I understand, thing is that this person claims on his web site that he does full restorations on Kenwood rigs and full alignments. So if that's the case then he should have the proper equipment to actually do this. If not then he's misrepresenting
his abilities and qualifications as I see it. I sent the rig to him based on all of this and actually speaking to him on the phone.
All done in good faith. I would understand if the rig had somehow burned or blown up in some manner, but none of this occured. Just one one day I fired it up and couldn't load and no TX or ALC, RX was fine all bands. I didn't want to play around with it myself because the rig means a lot to me. So I sent it out to him. Now way over 3 months later the verdict is that as he put it " throwing the towel in " claims he has over $700.00 worth of time in it, but will only charge me $100.00
plus shipping to get it back to me...Now that really sucks in my opinion .... I'm disabled and on SS so my funds are very limited
and now I have to give this guy $$$$ for nothing (sounds like a song to me lol) and still don't have a working rig. I have a TS50
that I'm using but I really want my 830 .... Guys thanks for listening and for the advice ..... Ruben KA2HHB

8421. transverters

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-07-29 19:48:56 UTC
From: yash@aol.com
Topic: 8421 Message: 8421

Have a beautiful ts-830s station,would like to add a 6 meter and 2 meter transverter. Want to keep every thing kenwood....so. I know I can do this any number of ways using other than kenwood transverters. But being that I want to stay kenwood does anybody know of any files,mods ,sites etc. that cover mods for using any of the many kenwood transverters with the ts-830. All my searches have come up) so far. I was able to do this with my ft-102, there were also no transverters for that rig also. Finally found a conversion ala,yaesu service done 20 years ago. I can't beleive that when the 830 came out everybody just dumped their transverters from the earlier rigs.
thanks for any help on this.

External speaker connection on the 830 is made via a miniature plug, not
an "RCA" or a phono plug. Phono plug connection is on the SP-230.

You said, "using any of the many kenwood transverters with the ts-830"
I find only two; TV-502/502S for 2 meters and the TV-506 for 6 meters in
the past Kenwood line. What other ones do you know of? No Kenwood
transverters were designed for the 830. The 830 does not provide any
external connections for various voltages that are required for the
TV-502/506, and some of the "other" transverters.

However, the 830 does provide transverter in/out connections via the
accessory jack.

Pete
your right,kept thinking there were a few others,guess not. Were not all the transverters solid state? Will download the manuals from rig pix and look . If one din;t need to supply bias and b+ then were just talking about line in and out and maybe alc control? Like I said ,I did a 1 page converson to a yaesu tv,that was for a 901 and got it working fine with a ft102. Just a idea at this point. Time for a little more research.

The tranverters are all solid-state.
QST Nov. 1985, page 59, "TV-502/506 Transverters with New TS
Transceivers", article might help to determine compatibility and
requirements to use one of these transverters with the 830.

8428. Are there any vintage Kenwood nets?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-07-30 16:30:09 UTC
From: Ellen R
Topic: 8428 Message: 8428

Hi Everybody,

I have a question for the group. As you know, there are vintage nets for Collins, Swan, Heathkit, etc. Are there any vintage nets for Kenwoods. If so, what are the nets' names, and what days, times, and freqs. do they meet on-the-air?

Thanks,
Ellen - AF9J

One upon a time there was a very active Kenwood User's Net on 14.317 that met every Sunday. It was started by the previous owner of International Radio (Rod somebody). It started in the early 80's and ran till the mid to late 90's. When he moved on to other prospects, the net faded away. I know of no other active Kenwood net, much less a "vintage" Kenwood net.

Of course, in today's times, one would have to define what "vintage" Kenwood rigs would fall under the name "Kenwood Vintage Net" if you had one. With e-mail reflectors, web sites, et al, one would wonder what advantages a "net" would have.

Dave,
That is true, But you would NOT need one to fix a TX problem.
The guy is Blowing Smoke !!

Ohhhhh, Okaayyyyy! LOL

The main reason I asked, was because, I'm looking for more excuses to use my TS-820. Also, I need to try out my loopy dipole I just builtSo, here goes:

Is there anybody out there interested in skedding Kenwood hybrid to Kenwood hybrid (or a similar classic radio for that matter [you know what I mean Bob])? Please let me know. A roundtable (like I used to get involved in on 160m, in college, with W9YT's TS-830S) would also be cool. Please let me know either on, or offlist.

73,
Ellen - AF9J

Hello James, as of last night it looks like this problem may be over.
The unmentioned person has agreed to return my radio and he will not
charge me for anything not even shipping. I wrote him a really nice
message stating clearly what I expected from since he didn't meet
his obligations and pointed out that he misrepresented.
I also said I wasn't looking for something for nothing, just wanted
the rig repaired. He did say that I didn't have to "threaten him".
The so called threat had to do with his states Attorney General and
e-Ham. Better for him to reurn the rig then to lose his reputation
and credibility in our community.
Gentlemen and Ladies as well don't be fooled by pretty web sites.
I want to thank everyone that offered their opinions and input, it's
because of your words that gave me the courage to put together a
really well thought out message to send to this guy. And it looks
like it worked.

Thanks es best 73 to all .. Ruben KA2HHB

Maybe you should pick a day, time, and approx. frequency to meet. With
1029 members in this Group, you might be able to gather a crowd. 20
meters probably would give you the best "group coverage". Of course,
depending on the number of gatherers, you need to determine if it will be
a structured net or just one based on anarchy(i.e. break in). Sometimes
gathering a crowd is easy; managing them can be the difficult part.

8441. Need Sugustion On Glue to Repair Plastic Gears in Kenwood

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-07-31 17:59:16 UTC
From: N3DOK
Topic: 8441 Message: 8441

Hi,
I have a TS-830S. I noticed that the sprocket gears (1 large,3 Small) on the 3 variable capacitors (RF Unit), that are connected by chain link to the drive control, have some cracks in them. This plastic is the same type that the shaft couplers are made out of.

I have an old plastic shaft coupler that I cut up in to pieces. I would like to find a glue that will bond these pieces together. But has anyone found a glue that holds?

The sprocket gears on the Drive Control 3 variable capacitors RF Unit. Has anyone had the sprocket gear break lose?

Thank You,
Bob N3DOK

8442. Touchy ALC meter

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-07-31 19:30:37 UTC
From: Kevin
Topic: 8442 Message: 8442

Has anyone experienced intermittent or no ALC by band with output meter reads still OK on Kenwood TS-830S?

On 20 meters I don't get any ALC reading. But reading wattmeter I get 90-100 watts. I've notice other bands sometimes ALC seems sporadic "touchy" or "jumpy" when tuning.

I have replaced the final tubes and 12by7 twice. Except same manufacturer both times for 12by7.

Makes it trickier to tune. On 20 meters I must use wattmeter for max instead of ALC. Called KH8SI on 20CW for 3 hours last night and never seen the ALC meter bump once. The Kenwood tuner wattmeter showed 100+ watts all the time. Driving amp to near full output.

I'd figure contact dirty for ALC circuit except always no read on 20m for some reason. While others read. Why 20m?

Rig was purchased new by me 1980's-ish.

tnx es 73
Kevin

Rene
try this. plug the 230 into the din plug in the back of the 830...wiggle it around and make sure it is seated all the way... same for the jack on the 230, it trips a small switch when inserted. turn the 830 on ,make sure the fix button is out, make sure your getting power to the 230 ...also plug in the 230's line cord. with every thing powered up pull the line cord for the 230 and let it sit for 1-2 minutes. then plug it back into the outlet.
My 230 does just what you said yours does and this cures mine all the time. good luck,hope it works.
if this fails check the service manual ...part of the 830 service manual and check out the small supplt in the base of the 230. also clean and check the bunch od cable connectors on the main board of the 230
good luck

That's how my TS830S started out, now I have no RX at all. Waiting on it's return from a gentlemen that couldn't
repair it, so I can send it out to someone that knows what they're doing.

Subject: [TS-520_820_ 530_830] Touchy ALC meter

Has anyone experienced intermittent or no ALC by band with output
meter reads still OK on Kenwood TS-830S?

On 20 meters I don't get any ALC reading. But reading wattmeter
I get 90-100 watts. I've notice other bands sometimes ALC
seems sporadic "touchy" or "jumpy" when tuning.

I have replaced the final tubes and 12by7 twice. Except same
manufacturer both times for 12by7.

Makes it trickier to tune. On 20 meters I must use wattmeter for max
instead of ALC. Called KH8SI on 20CW for 3 hours last night and never
seen the ALC meter bump once. The Kenwood tuner wattmeter showed
100+ watts all the time. Driving amp to near full output.

I'd figure contact dirty for ALC circuit except always no read on 20m
for some reason. While others read. Why 20m?

Rig was purchased new by me 1980's-ish.

I'd be willing to try it as a roundtable first on 20m. Mainly due to the fact that I'm not running big power into a big antenna (I'm just running barefoot into a loopy dipole [a dipole with each leg in an endfed loop configuration]). Since we have a fair amount of Generals in the group, 14.225 and below can be ruled out. I'll have to do some listening to see what's open frequencywise (you know as well as I do, that some hams get pretty testy on 20m, if you operate on "their" frequency).

If I find an open freq., I'll announce the day I'm going to try a roundtable. I know that the weekends are best for it, but QRM (and weekend things I do), may rule out Saturday or Sunday. I'll let you all know.

Just want to start put by saying, I have been in the shadows reading since I joined this group and have enjoyed the advice being given, so with that being said...

I am getting ready to start a ground up restoration of my beloved TS-520S, and am in need of the Paddle switches, has anyone found a suitable source for these? Also are there any pointers that can be given for such an endeavor?

hallo bob
try an epoxy resin 2 tubes mix worth its weight in gold around a radio you will find at your local hardware shop has the gear separated from the brass bushing or is it just cracked I gather it cracked where the two locking screws fit if the gear teeth are ok the ideal thing to fix this problem would be a thin tube slipped over the end and re drilled to take the locking screws thin brass tube and the place to find that is in the model supplier shop they should have a hefty supply of this material the people who sell model aircraft use it
just looked at my spare shaft for an 820 I have 2 out of three that are cracked hope this helps bob

Pete:

This one is easy..with a Kenwood net, rather than blog, chatroom etc
etc.. you can HEAR the advantages to owning a Kenwood! I haven't
heard anything yet..but you can imagine the reactions when other make
rigs' owners happen to listen in. (Just before they toss their rig
out the window.) ;)

The 830 has a socket for the driver tube, mounted in the RF unit board. The socket probably has bad solder joints.

Removal of the AF unit underneath will reveal an access panel that can then be removed to expose the bottom side of the RF unit board. Resolder the tube socket (use plenty of solder to get a nice fillet around each pin) and check for solder bridges. This will help. It may not fix the problem but needs to be done anyway, on all 530s and 830s, about every ten years.

I have not actually tried these on any Kenwood plastic parts but here are two that might work. I have used JB Weld, a two part epoxy for filling holes on panels and mending items around the house with good results. Another possibility is Gorilla glue. It is a single part product that is activated by moisture. I have used it on plastic that couldn't be joined with solvent based glues or epoxy.

Good product JB Weld, I used to sell it. I also used it on aluminum intake manifolds when the carburetor
threads were stripped out. Dries like steel but can be sanded to shape. I couldn't keep enough of it in my
store.

Subject: [TS-520_820_530_830] Re: Need Sugustion On Glue to Repair Plastic Gears in Kenwood

I have not actually tried these on any Kenwood plastic parts but here
are two that might work. I have used JB Weld, a two part epoxy for
filling holes on panels and mending items around the house with good
results. Another possibility is Gorilla glue. It is a single part
product that is activated by moisture. I have used it on plastic that
couldn't be joined with solvent based glues or epoxy.

8456. Poll has been started for deciding if a net will be held.

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-01 16:48:16 UTC
From: Ellen R
Topic: 8456 Message: 8456

Hi everybody,

I've created a poll for deciding whether or not a net for (ours and other) classic Kenwood radios will happen. Take a look at, and vote to let me know if you're interested in a net.

73,
Ellen - AF9J

8457. New poll for TS-520_820_530_830

Yahoo group: TS-520_820_530_830 (2006)

Enter your vote today! A new poll has been created for the
TS-520_820_530_830 group:

Would you like to participate in a net for classic Kenwoods? If so, there would be 3 choices of bands: 40m; 20m; and 15m. Please use the responses below.

o No, I'm not interested in a classic Kenwood net.
o Yes, I'm interested. I'd prefer the net to be on 40m.
o Yes, I'm interested. I'd prefer the net to be on 20m.
o Yes I'm interested. I'd prefer the net to be on 15m.

To vote, please visit the following web page:
http://groups.yahoo.com/group/TS-520_820_530_830/surveys?id=1648893

Note: Please do not reply to this message. Poll votes are
not collected via email. To vote, you must go to the Yahoo! Groups
web site listed above.

Thanks!

8463. If net occurs, what should be the cutoff for a classic Kenwood?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-02 11:25:33 UTC
From: Ellen R
Topic: 8463 Message: 8463

Hi again everybody,

As I mentioned in a previous post, the results look encouraging for holding a net (and possibly a roundtable on the runnerup band). I have another question for the group - what do we use as a criterion for a classic Kenwood rig?

1. Tube and hybrid Kenwoods only? - in other words the old Trios, Kenwood Twins, TS520, TS520S, TS820, TS820S, TS530S & SE, TS830S

2. All Kenwood rigs made up until the mid to late 80s? - which would also include such solid state rigs as the TS-120S, TS130S, TS-180S, TS-930S, TS-430S, TS-440S (a lot of hams claim that these rigs also have that killer Kenwood transmit audio)

3. All Kenwood rigs made up until 1990? - sort of make it an age related thing.

Any input would be appreciated. Well, I'd better get going to work.

73,
Ellen - AF9J

No.1 Tube and Hybrid Kenwoods only ....
You can always change it to No.2 depending on moans and groans and participants.

I was thinking that maybe we can hold a regular net (Kenwood Specific All Models) on a regular day say Mondays and maybe TS520 Thru TS830S on Wednesdays 1980's Models then on possibly Friday have a swap/4 sale net.
This should help in solidifying a regular frequency for us. Also post intentions on eHam. We'll have to first run some
tests on 20 to see how well the band is doing and at what time. Designate a Net Control and an alternate for each day. Alternates can be changed on the fly depending on band conditons if necessary for relay.

Hello,

Not trying to rickl the boat, just a thought. Why shut out anyone? If someone is thinking about getting a Hybrid Kenwood and wants to discuss it, or has had one in the past, he is not welcome? This is ham radio and everyone should be welcome. If the majority of the discussions is about Kenwood Hybrids, for the most part, only people interested in them will want to join in.

An example, the Collins CCA monthly AM night is tomight. They encourage all to participate, with AM rigs new or old.

IMHO

Best,
DW Holtman

I agree. The notion of the net revolves around the Kenwood hybrids and their interest. What you check into the net with should be immaterial. There would be no way to verify it anyway so why even bother trying to stipulate specific equipment use required to enter the net.

I second the notion.
I've had a 520s...great radio...I have a 830s and a 850s/at.
Both are also great. Whether I check in with the 830 or the
850 should not matter.....heck I may even use my 706MKIIG.

I'm sorry Pete, agreed it would be too much. I was thinking of myself, since I'm home for the most part with
lots of time available I didn't take into consideration all those that have jobs. I'm disabled with plenty of time on my hands. I'll be happy to help with whatever is decided upon. 73 for now Ruben KA2HHB

Ellen,

I agree wit Pete. The rig you check in with should not matter. Its the content of the discussion and the interest in the old rigs that matters.

No way to verify the rig anyway.

Ed, W9EJB

Based on the questions below, I've created another poll to keep
responses on the message board from getting out of hand countwise.
Feel free to place your vote.

73,
ellen - AF9J

Hoz about give two extra s-units on signal report for those stating
they are on a old kenwood? Shud be fun.

OK, I agree, the net will be about classic Kenwoods. It shouldn't be about whether or not you have one. That's kind of cliqueish. I should have realized that. Good point people. I'm going to close the new poll.

OK,

I'll keep the poll going. But the net will be open to anybody. It will be for discussing Classic Kenwoods. Whether the discussion will be about tube & hybrid Kenwoods only, or also include some pf the older solid state Kenwoods like the TS-120S, TS-130S, TS-180S, TS430S, & TS440S, I leave up to you (via the poll), the group membership.

Yup,

Definitely The TS-510, TS-511 and TS-900. Including the Kenwood Twins. We are a group who uses Kenwoods that have tubes/valves. Two of the poll questions deal with whether or not we as tube/valve rig users, should include older Kenwood solid state rigs (which some hams consider to be classics) in net discussion topics. That's the main reaon they were included.

If you are very brave at heart, use your soldering pencil to meld some of the 'plastic' over the crack. This will prolong the gear from breaking. Another thing to do is there is a "hot" glue that can be added to this to fill the crack. If you want I can look in my rig (TS830) to determine the type and maybe send you a sample. I have played with this some and have had some success. To use this, you are suppose to use hot air, but I have have made it work with the soldering pencil.

Hi,
I'm testing to see if some Glues that I have will "Melt" the sample piece that I have from a broken coupler. If I find the right Glue, I will let the group know.

This is a great group of people who are keeping the Kenwood HF radios on the air!

8489. UPDATE: My TS830S is back home !!!

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-03 20:59:01 UTC
From: Ruben
Topic: 8489 Message: 8489

Well after all of the drama, my TS830S is back home.
I'm going over it now just to make sure that nothing changed
internally. I plugged it in and everything lit up, but now I
have to hook it up to my antenna.
BTW....No charge

Thanks for the help Ruben..KA2HHB

Hi Ruben,
I'm sure happy that you received it back. I would like to think the whole ordeal was just a big misunderstanding.
I would like to congratulate you for showing restraint and NOT posting the guys Name or call. I hope the Rig works well and you are pleased.

You are a true Gentleman !
(Even if you are a Mopar fan) hi hi.....
73,
Gordon

Ellen:

I want to thank you for taking the initiative to organize a Kenwood net. Vintage Kenwoods and Yaesus are reaching the status of collectibles that Collins and Drake have enjoyed for many years. While it is fun to care for and restore these olde rigs, it is also fun to use them and talk with others who have this interest. Unfortunately, I do not have a operational home station at this time, but hope to have one operational by this winter. I do have my TS-820 (s) set up at the local Emergency Management Agency and operate from there once or twice a week. So whatever is decided as to a frequency and time, I hope to join you once in a while.

After I get my home station set up, I am sure that I will be a regular pest hi.

You're welcome Walt, :)

Just like a vintage guitar, car, motorcycle, or airplane, these rigs were made to be used, not just looked at. And, they sure do sound good in both receive and transmit audio!

Looking at the poll results, it looks like 20m is the band of choice, and by a small margin, the group wants it to stick to the topic of tube & hybrid Kenwoods (and Trios for that matter). I will leave the polls open through the weekend to finalize results (a lot of people don't check the group's hapeenings until the weekend).

With that in mind, I would like to try a pilot net on 14.288 MHz either tonight (around 2300 to 0100z timeframe for a start time) or tomorrow morning (1100 to 1400z timframe for start time), to see how things go. Everybody let me know what will work out the best for you. I'm at work, but I will check the results throughout the day. If any of you have better ideas for a start time or freq., please chime in.

73,
Ellen - AF9J

8494. TS520 ALC, Drive probs...

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-04 14:33:38 UTC
From: vk3bfa
Topic: 8494 Message: 8494

Hi good people,
this one is driving me absolutely NUTS - a TS520 that ahs been a real mongrel - took ages to get the rx working, now.... the saga so far....

Went to peak the driver cols, ie max ALC level on Tune position. Most abnds peaked, except for 21mhz. Fine, satrted looking for dry joints, loose switch conatcts - this radio ahd been got at by a succession of previous owners, so was pretty woeful. Resoldered all the coils on the formers, and on the PCB board.

Now, no ALC indication. Using the CRO on the grids of the PA tubes, lots of RF, but cant peak it on any band. More investigation, including (in desperation) pulling out all the coils to check them, and then hard wiring the coils to the switches via jumpers in case of broken tracks (impossible to do continuity checks as it was reading throught the coils.

Back together - now, still no ALC reading at all. Cant figure out how the ALC circuit works - where does it derive the sensing voltage from? - the alc line goes into q10 and so is supposed to vary the power - its stuck on a constant 2.6volts. As well, meter needle "whacks" on going from TX to RX. Bias conrol varies bias from -114 to (cant remember, its outside in the shack) but a reasonable swing. No PA current at all, irrespective of setting of SG switch.

Its now 12.30 in the morning, and I gave up in disgust - cant get my head round this one.....any suggestions (beyond a good nights sleep)

Somethings gone wrong, as well as the original cant peak drive problems.....

Andrew VK3BFA.

Topic: 8494 Message: 8496

Andrew,

My scanned copy of the TS520 Service Manual isn't very clear, but I believe that the ALC is derived by detecting grid current from the PAs. To get grid current the drive has to be sufficient to take the grids positive. You may have plenty of drive, as seen on a 'scope but it may not be enough to drive the grids positive. Of course, as soon as you start to drive the grids positive the input impedance falls and starts to load the drive, resulting in flat topping, non-linearity, inter-mod etc. So detecting grid current is a very good way of controlling the ALC.

The grid current is detected by Q10 in the RF Unit and the output of Q10 ultimately controls gate 2 on Q1 on the generator board and possibly one of the dual-gate MOSFETs on the IF board.

The scanned schematic is in three sheets and difficult to follow on a PC monitor!

Good luck and 73s,

Richard G3OTK

Be aware that the 20 Meter AM calling frequency and gathering spot is at
14.286. You can generally find AM'ers there most evenings. There's also a
West Coast AM group that generally meets there each evening. With typical
6 KHz typical AM bandwidth, they will be in your passband.

My mode switch is a bit loose on my TS-830S. Do I have to remove the front panel to get to the nut that tightens it down? If so, is there a trick to removing the knobs? Thanks in advance.

8500. Update on the TS820s mode problem.

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-05 00:31:50 UTC
From: m_m_maxau
Topic: 8500 Message: 8500

Hey Guys.

Thanks for the input with my old radio.

I have determined that the switch is the problem, the next question is, where can I get another mode switch from and other bits?

I have had a real good look at this old girl and she needs some help!

The radio is missing some ferrite tuning cores from the RF board (ouch) and needs some other bits as well.

I had to repair (by replacing) the large 450Volt caps on the Power supply as the radio had a voltage problem on TX.

I have now fixed that but cannot get the radio to tune over 4 watts on ssb.

I am guessing that the driver is working but the finals are crook.

I have a new pair of 6146W's to put in, so that should power the old girl up.

Just have to workout why the RX level drops as soon as you key up, to my mind (which has limited electrical knowledge), it sounds like a leaky capacitor or a dodgy solder joint.

Any feedback would be most welcome.

The best thing about this radio is that the digital readout works perfectly !!!

G'day Dennis

Yes mate,

Someone has made up a complete new board with the large caps as associated wiring from the transformer running into it.

The caps are 100uf @ 450volts.

Anyway, seems to work ok other than the other (multiple) issues it has!

Regards
Anthony

a leaky capacitor or a dodgy solder joint.

Any feedback would be most welcome.

The best thing about this radio is that the digital readout works
perfectly !!!

Subject: [TS-520_820_530_830] If net occurs, what should be the cutoff for
a classic Kenwood?

Hi again everybody,

As I mentioned in a previous post, the results look encouraging for
holding a net (and possibly a roundtable on the runnerup band). I
have another question for the group - what do we use as a criterion
for a classic Kenwood rig?

1. Tube and hybrid Kenwoods only? - in other words the old Trios,
Kenwood Twins, TS520, TS520S, TS820, TS820S, TS530S & SE, TS830S

2. All Kenwood rigs made up until the mid to late 80s? - which would
also include such solid state rigs as the TS-120S, TS130S, TS-180S,
TS-930S, TS-430S, TS-440S (a lot of hams claim that these rigs also
have that killer Kenwood transmit audio)

3. All Kenwood rigs made up until 1990? - sort of make it an age
related thing.

Any input would be appreciated. Well, I'd better get going to work.

73,
Ellen - AF9J

From: John Harp
Topic: 8370 Message: 8507

Greetings Joe.
I have had my first TS-830S for 25 years. It broke down on me. I kept it and bought a second one for $325. It's worth that much to me.

I always have a spare parts rig if nothing else, but someday I'd like to bring my first one back to life and use it either as a second reciever or else let my student I elmer use it. For now my Elmer wants to see it and use it. I have the matching speaker and the Digital VFO for split transcieve. I still use my MC-60 mic too.Some day I'll be a complete station.

Ask anybody whose on the bands these days, how good a TS-830 is for quality. As for me. I wouldn't trade it for an Ft100 MP. I think the reciever is probably just about comparable to it, especially for my hearing and what I use it for.

Just yesterday with 65 watts I turned on my speech compressor and pushed over the S7static crashes to get one more S9 report stateside.

Me I'd say, it's a good starter rig and I've heard others that kept thiers and won't let go either. Others that let them go and wished they'd kept it.Yes you can put a crystal in the bottom of the machine.You just hit the fix button and your'e there.

$400 is good price for you. I could get one a little cheaper just by sitting, but I say get it and get your General, and come join is and see for yourself why I say I'll take a tube hybrid. digital display and tube finals and all you need without bells or whistles.

Others may play with touch screens to make thiers do what it's supposed to do. I prefer buttons and knobs. It's right there in front of me.

SWR of 1.8:1 can shut a solid state rig down. I can push 3:1 on tubes and still be ok;5:1 can make grids get a little soft. I keep extra tubes around. They are 7 or 8 bucks for a driver and 6146's are still easy enough to find for around 40 bucks maybe a little more. Keep your drive cut back a little and your tubes will last. They won't even hear the difference on the other end.

If it were me, I'd say get one. I'd be suprised you'd give it up for something else or without some regret in the end. Come join us when you get your HF plus privileges and don't be afraid to learn to tune up right. Once you learn it, you'll get good fast.
73's for now. KA3DPW.

Joseph Hayes <von_landstuhl@...> wrote:

Hi all,

I just got my Technician license a few months ago and since then, I've
picked up a few military radios to play with on 6M and 29.6 Mhz FM.

Here's a picture of the "shack":
http://i4.photobucket.com/albums/y126/von_landstuhl/shack.jpg

I'm looking to get an HF rig and a co-worker has suggested the TS-830S. I already know not to pay more for the Gold Edition, so we don't have to go there. I want to work with Army MARS someday and would like to confirm something I read. Is it true the TS-830S can work outside the ham bands by installing a crystal in the bottom and pushing in the FIX button? If so, does this allow a range of frequencies or just the one freq?

It seems prices run around $400 on eBay, but I'm reluctant to spend that much money there because I don't want to get burned. Are there any reputable shops that tend to have them in stock?

Is there anything I should know before buying?

Thanks,
Joe

Ellen,
Have you decided on a Time and Frequency?
I have a great little TS-820 that I'd like to check in with.
I just finished installing New Finals and aligning it. Now I need to
sell it so I can buy another radio or two to repair. hi hi...
I'm working on a great little TS-520S at the moment.

73,
Gordon

Subject: [TS-520_820_530_830] Re: Kenwood net

You're welcome Walt, :)

Just like a vintage guitar, car, motorcycle, or airplane, these rigs were made to be used, not just looked at. And, they sure do sound good in both receive and transmit audio!

Looking at the poll results, it looks like 20m is the band of choice, and by a small margin, the group wants it to stick to the topic of tube & hybrid Kenwoods (and Trios for that matter). I will leave the polls open through the weekend to finalize results (a lot of people don't check the group's hapeenings until the weekend).

With that in mind, I would like to try a pilot net on 14.288 MHz either tonight (around 2300 to 0100z timeframe for a start time) or tomorrow morning (1100 to 1400z timframe for start time), to see how things go. Everybody let me know what will work out the best for you. I'm at work, but I will check the results throughout the day. If any of you have better ideas for a start time or freq., please chime in.

73,
Ellen - AF9J

While it is fun to care for and restore these olde rigs, it is also
fun to use them and talk with others who have this interest.
Unfortunately, I do not have a operational home station at this time,
but hope to have one operational by this winter. I do have my TS-820
(s) set up at the local Emergency Management Agency and operate from
there once or twice a week. So whatever is decided as to a frequency
and time, I hope to join you once in a while.

8511. My Latest project TS-520S

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-05 20:26:57 UTC
From: Gordon
Topic: 8511 Message: 8511

Hi Gang,
My latest project is a very nice TS-520S. I received it in on a trade. I removed the Covers and inspected it. It looks Very clean inside. First thing I noticed is that it has a 400HZ CW filter installed. I removed the HV cage and found that it has the Original S2001 tubes. So, I cleaned all the controls and the band switches. Flipped her right side up and appied power with the Heater switch Off (through the Transformer Saver) . Everything lite up. So I connected a Ground and then hook up the Antenna. Instantly I started hearing signals. Ok, So far so good.
I then checked the VFO and found that the small ring was a bit loose and the Main dial was off about 10KC. Removed the front knob, Removed the ring and got in there and adjust the main dial to be right on frequency.
I then removed the snap ring from the small wheel and adjust the tension spring. Reassembled it, and the VFO now works Perfect. I disconnected the transformer saver and plugged the power back in and turned the power on.
Then turned the heater switch on and waited for the girl to warm up a bit. Checked bias current. Readjusted to 60 ma.
Decided to tune into my dummy load for 20 meters and see what I get. Tuned right up with No trouble. Looks like I am getting a bit over 100 watts OUT to the load. So, I switched to my beam and hooked up my mic. Tuned across the band. Found the Football station on 14.257, decided I'd give him a call. He had a bit of a pileup going but Came right back to me on the first call. Gave me a 59 with a good audio report. So, Time to go in and align all the coils and see what I get on the other bands.
I will keep you all updated.

73,
Gordon

Well, After doing a Full alignment. I get over 100 watts out on every band except 10 meters, where I get about 75 Watts out.
Reception is excellent, The Cw filter works great and I get Good Audio reports. This little TS-520S works VERY well.
I am pleased as it seemed to take very little effort to bring it up to Top Notch.
so, Once I sell it , I will be looking to buy a New Project...

Anyone Interested in this TS-520S or the TS-820/Digital Display that I have to Sell ??

I might be interested in the kenwood rig, I currently have one that needs a little help, the previous owner disconnected the heater switch, and hot wired the heater so it is on all the time, He also put a toggle switch on the top cover to switch the cw filter on and off, it also needs the send recieve paddle switch replaced. and a good coat of paint. Other then those little issues it seems well. I get good reports as far as signal and audio. I love these old girls

8516. Vintage Kenwoods net - come one, come all

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-06 12:51:07 UTC
From: Ellen R
Topic: 8516 Message: 8516

Hi everybody,

Sorry I took so long to reply. I've been busy the last few days. Thanks for all of your suggestions and input. It looks like 20m will be the band of choice. It also looks like people are interested in it being on a late afternoon on a Sunday. People are done with things for the weekend, and a late afternoon Sunday net seems like a nice way to wind down. By a small majority you prefer the net to stick to tube, and hybrid Kenwood rigs for topic material.

With these thoughts in mind, I'm gong to try it out today at 2300z. The freq. will be 14.310 MHz. As a startoff duscission topic, we'll have intros, stating what you're running for gear. From there it'll go to whatever Kenwood tube & hybrid topic, anybody brings up. I may need help with relays, etc. I'm not running a huge station. See you on the net.

73,
Ellen - AF9J

8517. Summary of Data from QST Reviews of Amateur HF Transceivers

TS950SDX	12/92	<-40	-35	-137	131.5	93	+0.5	

N.L. = Noise Limited
dBpep = dB below PEP output power.

Notes:
1) When receiver values were given for preamp on/off, the preamp on numbers were used here. (or IPO/AIP off)

2) When values for more than one HF Amateur band are given, the worst numbers were used. (example: general coverage receiver numbers for 1.0 MHz were not considered, if a rig covers 50MHz, those numbers were not considered.)

3) Dynamic Range and 3rd order intercept numbers for the TS-450S and TS-690S do not indicate performance as bad as such numbers would usually warrant. Although 3rd order products appeared at the MDS level at a fairly low level, they did not increase in amplitude with rising input signal level as rapidly as one would normally expect. See the QST review for more details.

References:

"Using QSTs to Choose an Old HF Rig", QST, Feb 1987. Includes a table similar to the one above.

"The Product Review Process", QST, Dec 1985. Describes the tests that generate the numbers in the table, and how to interpret them.

8519. 150 Watts Out by an 820 ?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-06 20:15:18 UTC
From: Gordon
Topic: 8519 Message: 8519

I am having a disagreement with a fellow. He is telling me that he has owned many TS-820's that all put OUT over 150 watts on 75 meters into his dummy load. (Claims it is a Bird WattMeter)
Now, I did the math and 750 Volts at (a high) 250 ma of plate current equals 187.5 watts of Input. Now, considering these rigs run about 65% efficency, that comes out to 121.875 watts Out or even @ 70% only comes out to 131.25 watts.
Am I missing something here, or is this guy blowing smoke??
Perhaps I'm the one that is Wrong ??? Don't think so, But I have been wrong before..

If he is talking dead key watts on CW, no way.

One exception is a mod that hot rods the rig by doing things like upping the screen voltage. I do not recommend this mod. It strains the finals, transformer, antenna relay contacts, and other components. It likely increases the IMD. These are olde radios. Why hot rod them for less than 1 dB?

Ah yes! Those famous "Bird watts".
And/or, maybe he is diddling with a peak-reading Bird.

hi bill,

the part number for the plug is listed in the
database section of the list, as of today they are not
available at pacparts.com or kenwoodparts.com

the cable is straight connect, 1-1, etc.
pin #7 not used.

8+9 must be jumpered (you already know this)
1 and 2 are for external frequency display spectronics dfd/k or henry
model

Topic: 8519 Message: 8524

I would not recommend the power be that high on those rigs. Any radio turned up doesn't work better it gets worse, and it won't last long either. When you let the smoke out, they won't work anymore; of course then again, maybe the rest of us can have spare parts we need.HI HI

But seriously, think about it . Have you ever listened to some one on the air before and after they turned off thier linear. Sometimes it made no difference. apply that here, what good does it do.

If you need power use an amp.Turn back the drive and you'll get more out and it'll last.
Walt Breining <n9wb@...> wrote:
If he is talking dead key watts on CW, no way.

One exception is a mod that hot rods the rig by doing things like upping the screen voltage. I do not recommend this mod. It strains the finals, transformer, antenna relay contacts, and other components. It likely increases the IMD. These are olde radios. Why hot rod them for less than 1 dB?

I am having a disagreement with a fellow. He is telling me that he has
owned many TS-820's that all put OUT over 150 watts on 75 meters into
his dummy load. (Claims it is a Bird WattMeter)
Now, I did the math and 750 Volts at (a high) 250 ma of plate current
equals 187.5 watts of Input. Now, considering these rigs run about 65%
efficency, that comes out to 121.875 watts Out or even @ 70% only
comes out to 131.25 watts.
Am I missing something here, or is this guy blowing smoke??
Perhaps I'm the one that is Wrong ??? Don't think so, But I have been
wrong before..
73,

Gordon

I'm pretty sure he was referring to key down CW, But hey, I could be
wrong !
He did say it puts out 100 watts on ALL the other bands however !

At this Time, Both my Latest 820 and my 520S have been spoken for.
Thanks Guys for all the Interest. Now I am out of rigs to repair .. :-(

Guess I will play radio for a while hi hi..

I'm trying to buy an 830 that doesn't transmit, just trying to agree
on a price.
Oh yea, There is a guy on Ebay that is Parting out an 820S. Might be
some good deals there if you need some hard to find Pieces. He also is
selling some 520 parts. looks like he sliced up the whole rig and is
selling it piece by piece instead of the whole unit.
Do a search for TS-820.

There is no front panel control to "turn back the drive" to drive an amp.
You can "de-tune" the rig but that's probably just as bad, if not worse,
than over driving the amp.

Ellen R <ellenjoanne2003@...> wrote: Hi everybody,

Sorry I took so long to reply. I've been busy the last few days.
Thanks for all of your suggestions and input. It looks like 20m will
be the band of choice. It also looks like people are interested in it
being on a late afternoon on a Sunday. People are done with things for
the weekend, and a late afternoon Sunday net seems like a nice way to
wind down. By a small majority you prefer the net to stick to tube,
and hybrid Kenwood rigs for topic material.

With these thoughts in mind, I'm gong to try it out today at 2300z.
The freq. will be 14.310 MHz. As a startoff duscission topic, we'll
have intros, stating what you're running for gear. From there it'll go
to whatever Kenwood tube & hybrid topic, anybody brings up. I may need
help with relays, etc. I'm not running a huge station. See you on the
net.

Hi Ellen. Thank You for the info and the work done on the net thing. I will attempt to join you on the 20 meter band at 14.310 if the band will hold opening. Thats the reason I chose 40 in the vote. Nothing against anyone or anything, it's just a more reliable band heree in the sunspot lull. See you tonite hopefully. John-KA3DPW.

Hello Ellen,
Not wishing to cause any trouble, but those of us that live West of the International dateline such as those ZL or VK the Sched time is Monday morning.I am at work right now. I would love as I am sure other VK's or ZL's who work to take part in the net.

I know you cant please everyone all the time. Its a shame you cant run the net at Sat night in the US instead of Sunday night.
Just a thought.

73's
Mark.

Hi Ellen,
I listened for you on 14.313, but Nothing heard here. I did work Rick KC0HH and Steve K7QHU on 313. We discussed some 520/820 stuff and the fact that steve had just replaced the Product detectors in his 830 with better ones. His Signal sounded great.
I sure ish I could have heard you as well. The band is NOT very cooperative today.
If you drop to 40, please let us know the frequency so i can look for you. The ZL had a Valid point in his post. It is Monday there, and they are all at work at this hour. Perhaps we should move the net back to Saturday and let everyone play with us..

I will call until 0000z on 14.304, and then I will go QRT to eat some supper, and QSY to 40m, and try to get a roundtable going. It's looking like a no-go today on 20m. Also, as was mentioned in another post, it would be better for the VKs and ZLs, if we held it on a Saturday morning.

Today, condx. are part of the problem, the other problem is one I've encountered for years, some hams who don't seem to believe in watching their ALC.

I'll let you all know when I go to 40m - maybe we can get a roundtable going on that band.

Hi Gordon,

Yeah, Rick is the one who called me on 14.313, and informed me that the splatter was killing me (thanks for hearing me Rick :)). 20m seems to be really long. Also, I live a bit further north than most of you, so the condx on 20m are effectively at a later in the day time period, than they are for those south of me, in the same time zone. Yeah, preliminarily, I'm thinking that Saturday morning or afternoon would be best for the net on 20m.

I had planned on trying some 40m roundtables anyway. Soooo, I'm going to get supper going (I didn't get home from the animal shelter until 15 minutes before the net), QSY to 40m while supper is cooking, and tune for a clear freq. I'm hoping to find one above 7.225 MHz so that I can also get some General Class licensees to join in, but I'm not holding my breath. 40m is a QRM trainwreck above 7.225 MHz, due to all of the BCI. Usually when I find a clear freq. on 40, it's down below 7.170. Still, I will attempt to find a clear freq. above 7.225 MHz. I'll let everybody know what's up.

Catch you later,
AF9J

Hi Everybody,

I'm done with everything for the night. So I'm going to go ahead with my attempt at a 40m roundtable in place of the net that didn't get goin earlier today. I am on 7242 KHz. C'mon, let's see if we can get a Classic Kenwoods roundtable going on 40m. I'm calling now.

73,
Ellen - AF9J

Hi Ellen,

I actually heard you pretty well when you were calling 'CQ' in the clear, but the South American stations off the side took you right out. I would very much like to check my 830S on 40 meters to hear what swapping my product detector diodes out with Schottky barrier diodes did. It made a very notable improvement on 20 meters. Much quieter ....I will not be able to get on 40 until about 11:00 CDT, but I will tune around.

Hi Rick,

Thanks for coming back to me on 20m. At the risk of sounding like a jerk, I have to ask this question - why do so many South American stations drive the living daylights out of their mic ALC circuits. Do they actually think that by maxing out their mic gain, they'll put out more power, and get out better? I've been dealing with this problem, ever since I got my General License back in 1986. I admit, they aren't all like that. I've heard and worked some South American hams that are fantastic operators. But, so many of them operate like CBers using illegal amps.

With regards to 40m - I don't know if I'll last until 11pm. I tell you what - I'll take a nap until 11pm. We can try to hook up on 40 then. I'll find an open freq. on 40m,and start calling you. I'll let you know via a post, what freq. I'm on. Until later.

73,
Ellen - AF9J

Norte Americanos do the same thing; I think it's macho to watch my ALC meter slamming the right hand peg. The very idea of the gold plating coming off my 8877 grid on voice peaks gives me shivers.

If I crank my max output on the 850 all the way down, I get 4.5 watts out and the ALC will stay pegged on the right which is very gratifying.

tongue in cheek here of course.

Probably cause they either disabled, or don't use an ALC connection
between their exciter and amplifier. Not uncommon if you envision
yourself as a DX entity and want to have a strapping signal at all
costs. It's an ego thing.

OK, I'm now on 7242 KHz. I'll start calling CQ.

Hi Gordon (and the group),

Here is a pdf file that is the spec sheet for the 1N5711/1N6263 dides I used in both the product detector and balanced modulator in my 830S. The results are amazing. I do not have a scope to look at either receive or trasnsmit audio but I have a program that uses my P.C. and sound card as a spectrum analyzer and feeding receive audio and transmit audio via the monitor circuit results in much lower noise spikes. Not scientific at all but a noticeable improvment.

I enjoyed the short chat on 20 meters today.

It's not clear to me how adding shottky diodes to the balanced modulator or product detector would give this result: "results in much lower noise spikes". I can only assume you saw this result on the receive side. If so, what was your noise blanker doing during this time (in/out)?

I figured this all was going to happen; hence my original statement about the net several days ago. My personal opinion would be you'll never please everyone time wise on the reflector with over a 1K worldwide members. Plus, frequencies being occupied where you want to have the net, adjacent QRM, changing band conditions, etc. all play into a very frustrating experience for all who want to participate. I would suggest identifying a range of frequencies, say on 20, 40, or 75 meters where typically "vintage" Kenwood rig owners could hang out. Members could frequent those frequency ranges at times based on their area of the world. Members could call CQ vintage Kenwood user's group or something like that. Maybe after several weeks of this type of semi random activity, and members reporting back to the reflector on their contact successes, a clearer picture of times, frequencies, band conditions, etc., i.e. when most people seem to be collecting around a particular time/frequency etc.

If we had audio on this reflector, we could have vintage Kenwood chat room and it could be open 24/7. Wouldn't even have to call CQ. Just bang on the microphone and yell YO.

8566. TS520S pa bandswitch required..

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-07 12:02:15 UTC
From: vk3bfa
Topic: 8566 Message: 8566

OK, this is probably a forlorn hope, BUT - anyone got a spare TS520S pa bandswitch lying around (its the one living in the pa cage) - I fixed the drive tuning problem I spoke of the other night (broken track on the driver PCB) and on test, the damm pa switch started arcing over .....now halfway through (literally) dismantling the pa section to get to it, but logic tells me it will be stuffed. Looking for a new (hah!) bandswitch, Kenwood report them as "discontinued" - could POSSIBLY wire a string of relays in their ALA TS440 etc to do the job, but would be tedious to say the least.

Andrew VK3BFA.

8569. Re: Kenwood Net

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-07 13:14:18 UTC
From: Ellen R
Topic: 8508 Message: 8569

Hi Pete,

I won't lie, I had many of the same misgivings myself. I live in an apartment, so I don't run a KW into a 5el yagi at 100 feet, on 20m. Therefore, I'm not the ideal net control station, especially for a worldwide net. I gathered data on nets that are held on 20m, and chose a freq. that wouldn't conflict with other nets. Unfortunately, it's impossible to control/account for random QSOs or skeds that may pop up. Still, I decided to make a go of it.

I do agree that more listening needs to be done to decide what freq. would be best for a 20m net. As it is, due to propogation characteristics on 20m, there would need to be a lot of relays (and therefore relay stations), in order to hear everybody.

Maybe the way to go about this is like groups such as SKCC and HFpack do: Post/announce that you're looking for either QSOs, or to hold roundtables with other group members. The postings could be done in advance, or during the times you wish to operate. This seems to work well for both groups. With that in mind, I will make an effort to do just that over the next few days. Once again, I will be helping out at the animal shelter tonight, and probably won't be home until after 0100z. If I'm not too tired (I've been up since 4:30 this morning), I will try to initiate another 40m roundtable. I'll let you all know later on.

Well, back to work for me.

73,
Ellen ☐ AF9J

Hi Pete,

I was referring to the spectral display of my audio white noise before and after I swapped the diodes out. I use a program called HamAlyzer which produces a spectrum analyzer using your PC and sound card.
I just fed receiver audio into the PC. The receiver was terminated with a dummy load and the NB was off. I had my Fluke across the speaker terminals to get as close to the same level of audio in each check. I am sending you a jpeg of the display. It will be filtered out of the Group but you should receive it. The blue trace is the original audio and the red is after replacing the product detector. Interesting mod. The transmit audio is similarly improved with replacing the noisy 1N60 balanced modulator diodes with the Schottky. I had good results using the 1N5711

Ellen kudos for your efforts to pull together a net. I tried to listen in also, though I was just a little too late on 20m (and apparently too early on 40m). There is clearly interest, and I encourage you to try again. Don't worry about conflicting frequencies or schedules, just post here when you are going to try and who ever is available can get on the air. I think an ongoing effort approximately weekly, would tend to build up a following over several weeks.

Thanks!

Subject: [TS-520_820_530_830] Re: Kenwood Net

Hi Pete,

I won't lie, I had many of the same misgivings myself. I live in an apartment, so I don't run a KW into a 5el yagi at 100 feet, on 20m. Therefore, I'm not the ideal net control station, especially for a worldwide net. I gathered data on nets that are held on 20m, and chose a freq. that wouldn't conflict with other nets. Unfortunately, it's impossible to control/account for random QSOs or skeds that may pop up. Still, I decided to make a go of it.

I do agree that more listening needs to be done to decide what freq. would be best for a 20m net. As it is, due to propogation characteristics on 20m, there would need to be a lot of relays (and therefore relay stations), in order to hear everybody.

Maybe the way to go about this is like groups such as SKCC and HFpack do: Post/announce that you're looking for either QSOs, or to hold roundtables with other group members. The postings could be done in advance, or during the times you wish to operate. This seems to work well for both groups. With that in mind, I will make an effort to do just that over the next few days. Once again, I will be helping out at the animal shelter tonight, and probably won't be home until after 0100z. If I'm not too tired (I've been up since 4:30 this morning), I will try to initiate another 40m roundtable. I'll let you all know later on.

Well, back to work for me.

8577. CW/PC/Keyer interface...

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-07 20:07:28 UTC
From: Chuck Poindexter
Topic: 8577 Message: 8577

Hello everybody,

I am currently using the N3FJP logging software with my TS-520/ straight key rig. I would like to use the PC to call CQ for me now and then so it does not get so monotonous. The schematic I used for this interface is http://www.n3fjp.com/ParallelSchematic.jpg - from the N3FJP page, which connects the parallel port to the key jack in the back of the radio. The problem is that when the plug is inserted into the jack, it acts as if the key is being held down and goes to transmit (when VOX is on).

This also exhibits the same behavior with a Ramsey CW keyer kit that I put together, connecting the output of the keyer circuit to the key jack in the back of the radio, as well. As long as it is plugged in, it thinks a key is being held down, tries to transmit with VOX on. Otherwise, it just emits the tone.

Any tips on an interface like this? Has anyone here tried something similar? Am I using the correct circuit? Help?

Thanks and 73s
Chuck

Chuck,
I may be wrong but I think the circuit is shown as being wired for
a solid state rig. I think you need to wire the Optional terminal to
the center connector of your Key plug and disconnect the one you have
there now, basically bypassing the 2N222A transistor. The Old Kenwoods
with Tubes are Grid Block keyed. Not positive (Direct) keyed as the
newer solid state stuff is. I could be wrong though on that particular
circuit.
I know if it is wired for active low and you need active high, it will
key the rig as soon as you plug in the Key Jack.

Hi Chuck

You must put a gretz between the computer interfacing cirquit (after the transistor/optron) and the transceiver.
I am using such a keying cable for a years with my TS830S.

HI Chuck,

The newer solid state radios use direct keying for CW transmission. Older radios with tubes such as the hybrid Kenwoods use grid block keying. I don't remember the exact voltage but the Kenwood keying potential is at something like -65vdc. You could replace the little 2N2222A transistor with a larger NPN transistor that will handle 100vdc Older keyers such as those made by MFJ had two different outputs on the rear. One for direct keying and one for grid block.
Your keyer schematic shows 5vdc available on transmit. Radio Shack sells a 5vdc reed relay. Wire the collector of the 2n2222A to ground. Hook the 5vdc and the emitter of the 2n2222 to either side of the coil of the relay. Hook the common contact of the relay to the shield and normally open contact to the tip of your 1/4" plug The relay will key your radio for CW.... Works fine for speeds up to 30 wpm.

Hi Ron,

Thanks for the encouragement. :) As I said to Walt, these rigs are made for using, not just looking at/admiring. I'm hoping to try an informal roundtable/net later on tonight, if I don't get home too late from the animal shelter I volounteer at.

I'll post on the group if it's a GO, and if so, what freq. I'll be on.

Hi Gordon,

Yep, that would work except the 2N2222A is only rated at 40vdc max. A little light duty for the Kenwood keying potential . If you substituted a MPSA42 (200vdc NPN) transistor, you would never have to worry about it.

Hi Rick,
But isn't the way I changed the circuit going to basically
eliminate the 2N2222A completely? All the switching should be done by
the 2N3906
I'm not sure what the rating on the 2N3906 is though.
Need to look that up. :-)

It is possible that if his SWR was higher on 75 that under some conditions the reverse power could add to the forward power causing a high reading.

Ellen, I can meet you there on 7242. I have 100 watts and can reach 8 and 9 land pretty much continuosly. In fact, most anything east of mississippi river. Even during the day. I got a full size ground mounted quarter-wave with 56 radials for the ground plane. It's fed by 1/2inch cellwave 115 feet long to a TS-830S. It's a good 40 dx. My linear is in the shop for repair at the moment. John Harp - KA3DPW General Class Liscencee-Parkesburg PA. Bac2U

Ellen,
I like what I've heard so far and responses of this group.
I do have a few questions being a new member and not familiar wioth
the group yet.
1)I'd like to know how many of these members are we considering for
the size of the net?
2)Has any contact been made with other PR sources and perhaps
conferred with other net control operators (on the side) for
suggestions?
3)Has possible consideration been given to localized net with
giving invitation to checking into other area nets when feasible.
4)A reflector idea on VOIP to link local is another possibility.

We have today some tools for communications that we didn't have back
when these radios were new.The possibility tying these other modes
in may help us reach our goal. One step further, It may set a good
example in our listening communities minds,Be it other Amateurs or
even the FCC itself.

So I'd like to give this brief persective to the group to discuss.
There will be other ides I'm sure. But one thing is for certain, we
are communicators first and technicians second. I believe there is a
good team here pulling together a good concept. Perhaps a little
more definition and refinement is what we need. Thank You.

Hi Gordon,

I don't think the 3906 is heavy enough either. I think the original circuit will work fine if he uses a heavier rated NPN transistor such as the MPSA24. The 3906 will switch it with no problem. The Kenwood's keying potential voltage is obviously too high for the 2222 as the radio goes into transmit as soon as he plugs the 1/4" plug in. Like I said, I think it is somewhere around -65vdc.

Hello,

I do not use direct semiconductor keying for the evil never sleeps. Rig is 530 but it is indifferent. The interface is a transistor with a resistor and a diode. The collector and ground is connected to my traditional el-key. There is a relay in that and the interface agitates the relay. So the trx keying system is quite independent (isolated) from both the computer and el-key and it is a combined (computer/hand operated) keying system. Vox on and CW works, no need for PTT.

On the other hand the layer cap of semiconductor helps to cause harmonics problems in the trx in case of direct keying so you'd better do to avoid it.

The best solution is to get a DIL IC reed relay for a few bucks (5V, 12V dc - as you like - and 1kV isolation capability) so to set up an independent keying system. Computer, trx and anything else have to be on common ground.

Should you do that you have protected the computer, the rig and cw works smooth. I have now more than 17,000 cw QSO with the 530 in the last 2 and a half years. I even take part in contests actively using 22-28 WPM. Could you believe that a 5XX is a good contest radio?

8595. Low receive on 3.5, 7.0, and 10 MHz bands

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-08 01:30:05 UTC
From: Ken Gunton
Topic: 8595 Message: 8595

I intermittently have low receive signal on these bands. One symptom is that the Drive control has no apparent effect on receive. Other bands seem just fine.

Any ideas on what might cause this? Transmit output seems okay.

By the way, my VFO was jumping around so I took the advice found on this group regarding backing out all the Phillips screws and re-tightening them, and the problem was instantly fixed. Thanks for all the great advice.

You have to double the power for 1 S-unit, right? Why in the world would one want to stress the PA circuit for such minimal effect as a 25% increase would yield? Get a linear if power is that important. These are solid old radios, but they don't take abuse any better than any other machine. There's a reason why so many of them come in with smoked screen bias resistors.

8599. Re: Kenwood Net

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-08 04:24:40 UTC
From: Ellen R
Topic: 8508 Message: 8599

Hi John,

At the present time, things are being formulated. I'm not sure how formal I want to get with the net. It originally came about, because of a question I posted: There are nets for old Heathkits, Collins, Swan, etc. So I wondered of there was a net for classic Kenwoods, like we all have. Everybody told me that there hadn't been one in a number of years. A suggestion was made that maybe starting a net should be looked into. So I looked into it, and decided it might be nice to have one.

I just don't know how elaborate I want to get about it. It's too late for a roundtable tonight (I just got off the phone with a dear freind, who called me out of the blue), so I think I'll try doing one tomorrow. Maybe by doing a roundtable first, we can get it to grow into a net.

Well, it's late, and I'd better get some sleep. Good night.

73,
Ellen - AF9J

8604. Sweep Generator?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-08 12:19:55 UTC
From: K4MT
Topic: 8604 Message: 8604

Anyone have any suggestions on an affordable sweep generator available on the used market that would be suitable for filter alignments on the Kenwood radios? Any that you have used that worked OK and not $1000.00?

I believe my TS-520 has some receive audio problems that might be bandpass misalignment. This did not go away even after aligning the rest of the radio.

Thanks Gary

I have to agree with all of you,

For starters 1 S-unit is about 6 dB difference. That's 4 times more power. Gee, can you say (depending upon the Ken wood rig) 400-480 watts out? No can do, without not only changing to a different type of final tube setup, but gutting and replacing the power supply. It's not worth it. So why even bother driving the finals harder just for an extra 25% power? It seems kind of greedy to me - like you're trying to get something for nothing (as in being too cheap to just buy an amp).

73,
Ellen - AF9J

8608. Anybody interested in trying a roundtable tonight?

Yahoo group: TS-520_820_530_830 (2006)

Topic: 8608 Message: 8608

Hi everybody,

I got home late from the animal shelter last night (as in around 9pm). Nevertheless, I fired up my baby to let it warm up, and let the VFO settle down, to try asked. Then my phone rang, and I ended up being on the phone until after 11pm. So, I never did get on the air.

Tonight is different. I'm done at work as of now, and I should be home before 6pm CDT (I have a few things I have to do before I get home). So I should be able to get on the air tonight.

Is anybody interested in trying to do a roundtable tonight? If condx. are OK, I'll try 20m, but more than likely it'll be on 40m (or if that's long, 75m).

I'll let you know later on, what freq. I'll be on, and when I'm on the air. I hope to hear some of you tonight.

73,
Ellen - AF9J

Check the resistance of the wafers on the contacts at close. Use a multimeter to see the resistance. more than >1 probably is the culprit.

Subject: [TS-520_820_530_830] Low receive on 3.5, 7.0, and 10 MHz bands

I intermittently have low receive signal on these bands. One symptom is that the Drive control has no apparent effect on receive. Other bands seem just fine.

Any ideas on what might cause this? Transmit output seems okay.

By the way, my VFO was jumping around so I took the advice found on this group regarding backing out all the Phillips screws and re-tightening them, and the problem was instantly fixed. Thanks for all the great advice.

From: John Harp
Topic: 8595 Message: 8612

Ken,
1) Get some contact cleaner and spray the contacts real good. Rotate them back and forth and spray some more.I use lectra clean or CO Contact Spray on mine.even clean the chain drive assembly. Spray that with tri-flo. the ptfe base lubes them real good.

2) Alot of times the wafer switches need attention on my 830 rigs too. If you must clean the pittings use a burnishing tool. If its worn beyond the plating get one of those Conductive Ink Pens andDe-Ox from Radio shack.De-Ox first then coat the contact area itself. Get the plating area clean including all residue and corrosion.This removes the resistance of that RF contact and with the conductive coating applied, the resistance is cut down enough to get the signal across like it should.

3) Back the screws out and remove the lock washers. Turn them a little bit to catch a fresh spot maybe clean the area with de- or contact cleaner or de-ox too. Put the screws back in and tighten them. You don't have to torque hard on them, but tight so they don't back off. A lot of times the humidity and pollutants in the air reside at these spots.

4) On mine, I spray the Pots and switches from the slot in the back of the part and spin the knob while I'm in there. I've gone after the connectors before too.Pull them and spray and put them back on a few times, cleans them up.

A site to see an example on is Ken's K4EAA web site. He has a good example of the restoration. Do the processes a little at a time. Don't try to go at it all at once, do a little bit at a time.

Ken Gunton <ken@...> wrote:
Sorry. TS-830S. This just started happening. Guess I'll
have to go find some De-ox-it and get to work. The
bandswitch itself, including the couplers, look okay
at first glance. No obvious cracks.

Hi Bill,

The power cord plug is of the type known as a Cinch-Jones plug. They were very commonly used on ham radios in the 70s. My TS-820 has one, Yaesu, and Drake also used them. The plugs are still available to the best of my knowledge.

Hi again everybody,

Sorry this is late. I was all set to go at 0045z, when I got a phone call from friend who lives in California, who was feeling bummed out. Rather than hurt her feelings, and I spent the next 2 hours on the phone letting her talk, until she felt better. Oh well.

40 is dead, so I went to 75m - only to find out the hard way that my modified antenna will only load up when fed in a T configuration. Ugh! it's late but if any of you night owls are up, I'm still willing to give it a try on 75m, eventhough it's noisy. I'll be calling on 3897 KHz. If I hear nobody after 15-20 minutes I'll go QRT. So ahead of time, I'll say good night to all of you.

Hi
If you want a net or round table,I suggest you stay on either 17 or 20 meters. Why... because most hams have the ability to run 17 or 20 as opposed to doing 75-80 . 40 meters at nite for a net ,is not worth the effort
considering the bands condition at nite. My suggestion,for what its worth , is try weekend daylight hours on 17 or any time on 20. Forgot some of the old Kenwood can't do 17, so scrap that. My 20 meter beam turns,my 40 meter dipole does not.
Just a thought.

Hi Bill,

The power cord plug is of the type known as a Cinch-Jones plug. They were very commonly used on ham radios in the 70s. My TS-820 has one, Yaesu, and Drake also used them. The plugs are still available to the best of my knowledge.

Hi Bill,

The TS-520 is the very first model of the 520 series (and also the first of the Kenwood hybrids). The 520S is its successor. The biggest difference, is that the TS-520 covers 80-10m, whereas the TS-520S covers 160-10m. There are some other differences beetween the 520 and 520S. If you'd like to know what they are, here is a link to K4EAA's website. He not only repairs them, but describes each model:

http://www.k4eaa.com/types.html

8625. Roundtable or QSOs - OK, let's give it another try

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-09 16:45:11 UTC
From: Ellen R
Topic: 8625 Message: 8625

Hello again,

At the risk of looking like a complete fool, I'm going to try again tonight. I'm looking for people who either want to QSO me and my TS-820, and/or (if enough people show up) try for another roundtable. The solar flux is lower than low (I just checked now, and it's only 71), so I will only briefly check 20m, to see if anything's happening. More than likely (assuming that another one of my friends doesn't decide to use me as their phone therapist again), I will be QRV by 7pm on 40m. It looks like 7248 KHz has been reasonably clear for me, so I will call there. If that freq. is bad, I will look elsewhere on 40, and let you all know where I am.

If 40 is the pits, I will NOT go to 75m. It may have been noisy, but I was reminded that 75 is a zoo most of the time (which is one of the reasons I typically avoid it like the plague). If 40 is bad, I will instead try 160m (yeah, I know it's noisy, but I know from past experience, that 160 will occasionally surprise you by giving even barefoot stations with marginal antennas, S9+ signals during noisy condx).

73,
Ellen - AF9J

Hi Dale,

I agree, 20 would be the best. I am just treating what I'm doing during the week, as a way to get something going. It's not a net per-se, and I never intended it to be one. It's more like an exuse to get some Kenwood hybrids together.

I've been listening on 20m after 2300Z lately, and frankly in the northern US, it hasn't been very useable by that time of the day, so yes it would have to be used for a net on a Saturday morning or afternoon.

So you have a beam..... hmmmmmm. Interested in being a net control?

Some power cord plugs are numbered as a mirror image to others. If this is the square plug as opposed to a round one, you should be very careful to check for this.

Thanks for listening Ken,

I didn't hear any replies on 40m, and I called until 5 minutes ago.
What signals I heard on 40, were from the deep south. If you'd like
to, I'm willing to try 160. I'm up around 1900 KHz.

I have a G5RV Junior, and my MFJ 949 won't tune it to 160, so
I guess we'll have to call it a bust... sorry.
Maybe sometime during the day on 20m.

Hmmmm,

I only have to to work a half day on Friday. If you'd like to try 40
or 20m after 12:30pm your time, I'm game. I'm in Wisconsin, and
you're in Ohio. At that time of the day, it might be hard to decide
which band is best (possibly 40).

And to add to the list, the TS-510 and TS-900 were also hybrids. Maybe
his definition of a Kenwood hybrid is solid-state and only 3 tubes.

She stands corrected,

The TS-900 is a pretty cool looking rig. To top it off, it also has AM capbility. If I could find one that wouldn't break the bank for me, I might be interested in it. My only downer about it, is the sweep tubes. Yeah, I know, if you take care of the sweep tubes, they can last as long as 6146s. But, I still have visions of them being as fussy as the sweep tubes were, in a Swan Cygnet I used for a few months back in 1993, right after I got my Advanced license. You had to be VERY careful with tuneup in that rig (the manual stressed it over and over), to avoid wrecking the sweep tube final. As a result, unlike my TS-820, tuneup was very fussy. You had to key down for no more than like 20 or 30 seconds. Then you had to wait at least 30 seconds (so the sweep tube final cooled down), before you keyed down again, to do the next tune-up step.

Wow. 20 or 30 seconds? That seems an incredibly long time for tuning. What did you have to do to tune that rig?

One thought has crossed my mind: Is there any interest among the group members in having some kind of informal gettogether during next year's Hamvention? w8bi.org has the dates, etc. If there is enough expressed interest, I would take on the task of setting it up.

If someone among us is conversant enough in these hybrids we all like so much, how about a presentation in one of the rooms at the Hamvention on the proper care and feeding of your rig - maybe even with a project rig right in front of the crowd with a video camera so everyone can see what you're doing.

Ok, ok, those are TWO thoughts. Sue me... hi hi

Hi Bill,
as explained, mainly more bands on the S model, and the PA deck uses a
PCB base instead of being hard wired. Also, there are subtle changes
in some of the resitors (from memoory, the cathode resistors of the
12BY7 driver) - why they did this, I dont know....

Bring good comfortable walking shoes; cash and carry works in the flea market; if you see something you like in the flea market but hesitate, (i.e. I'll come back later); the odds are you won't be able to find the space again, or, if you do, the item will be gone; bring a strong bag to carry "things" in. You can always find me at outside spaces 1960 and 1961, on the corner.

Yep, sweep tubes can be problematic if you're not careful but Drakes, Swans, Nationals, and a host of others used them for a number of years in their rigs and many are still in use today. The Kenwood 599 series has AM capability with excellent low level modulation. I've used my 599D's on AM for years. Most people I contact can't tell that I'm not running a plate modulated rig.

I remember my elmer having a 520SE. That thing had a TVI problem fir 5 houses around, even with the harmonic filter on line. Dale eventually got a 820 and it solved the problem. He said it was the sweep tubes. Why is sweep tubes a problem?

520SE doesn't have sweep tubes. It has pretty much the same final layout
as the 820.

Ummm, it was made to a cost, and as a result, Swan cut corners on some of the components. A friend of mine who knew some of the people involved with Swan told me this (when she lived in San Diego, she worked for Cubic, who bought out Swan before her time). As a result, the sweep tube didn't have a lot of margin in plate dissipation. Sooooo, when the final was really out of tune when you started tune-up, there was a real risk of burning it out. There are mods that can be made to the early Swans to rectify this problem. Also, Swan did improve the disspation capability on it's later rigs. A fair amount of the issue was tube related (and as a result, they tried and used different sweep tunes in later Swans). It was also the way they biased the final tubes that were used.

I remember being very surprised and diappointed in the tune-up procedure. I had owned an FT-101B, a T-4XC, (briefly) a TS-520S, and had used a TS-830S. All of these rigs were easy to tune up. You just had to peak the drive, dip the plate, and peak the load. On the Swan, I had to be very fast & very careful. First you had to bring drive up to 120 or 140mA of plate current. Then you had to peak out the load, repeak the drive, and repeak the load a number of times, till your readings quit changing. Then you were done. All the while, you had to watch keydown, and (final) cooldown time, so you wouldn't nuke the final. Once the radio was tuned the final was reasonably happy, and would hold up pretty well. It's just that it took so long to tune the thing - about 3 minutes. I actually used the Swan Cygnet I had loaned from my local radio club for about 3 to 4 months. I even used in the the SSB edition of the NAQP contest. I tried to keep down my bandchanges - that's for sure!

Here's an ironic thing - a friend of mine who likes vintage radios, thinks Swans are cool. But he's tight for money. I don't live in Manitowoc, WI anymore (I live in the Milwaukee area nowadays), but I still have contact with the president of Manitowoc County's ham club. I asked him, if the club still had the Swan Cygnet,l because I knew somebody that might be interested in it. I was informed that yes, the club still had it, and was looking to auction it off anyway (along with some other radios - one was an HW-100), to earn some money for the club. So, after consulting with my friend, I put in a bid for $100 for the Swan Cygnet. I checked my e-mail 2 hours ago, and I read a message saying I'd won the bidding. If my friend can't afford the rig, or has changed his mind, and doesn't want it, it'll end up being mine. Oh, well.

Don't get me wrong, Swans aren't bad rigs. It's just that you have to careful with them. They make great phone rigs, and even have AM capbility (albeit AME [SSB with a carrier]). They aren't good CW

rigs, and the receiver selectivity is a little wide for crowded
bands. Still, like our Kenwoods, they have great phone audio.

73,
Ellen - AF9J

Hi John,

The 520 did not use sweep tubes, it used 6146Bs, like the 520S, 820, 820S, 530S, and 830S.

When I think about it. Theree's times when I wish I knew more about these hybrid rigs, I must admit. Sometimes, there's just not someone around when I really could use some insight. Al I've had for 25 years was the 830s. But still on occasions I find I could learn just a little more. People to repair them are getting harder to find too. Some knowledgable Hams are now SK too.

Wow. 20 or 30 seconds? That seems an incredibly long time
for tuning. What did you have to do to tune that
rig?

One thought has crossed my mind: Is there any interest
among the group members in having some kind of informal
gettogether during next year's Hamvention? w8bi.org has
the dates, etc. If there is enough expressed interest, I
would take on the task of setting it up.

If someone among us is conversant enough in these hybrids
we all like so much, how about a presentation in one of the
rooms at the Hamvention on the proper care and feeding of
your rig - maybe even with a project rig right in front
of the crowd with a video camera so everyone can see what
you're doing.

Ok, ok, those are TWO thoughts. Sue me... hi hi

Subject: [TS-520_820_530_830] Re: TS-520

She stands corrected,

The TS-900 is a pretty cool looking rig. To top it off, it also has
AM capbility. If I could find one that wouldn't break the bank for
me, I might be interested in it. My only downer about it, is the

sweep tubes. Yeah, I know, if you take care of the sweep tubes, they can last as long as 6146s. But, I still have visions of them being as fussy as the sweep tubes were, in a Swan Cygnet I used for a few months back in 1993, right after I got my Advanced license. You had to be VERY careful with tuneup in that rig (the manual stressed it over and over), to avoid wrecking the sweep tube final. As a result, unlike my TS-820, tuneup was very fussy. You had to key down for no more than like 20 or 30 seconds. Then you had to wait at least 30 seconds (so the sweep tube final cooled down), before you keyed down again, to do the next tune-up step.

73,
Ellen - AF9J

20-30 seconds is a very long time to tune a tube rig.
I tune my Swan 270 in 2-3 second steps. It actually tunes much faster than my Kenwood 520S.
Incidently, the 6LQ6 (actually, mine has a
6ME6) final has been putting out full power (150-170 watts peak SSB) for the time I have owned it: over 10 years now.

HI Bob,

I have a feeling it's going to be mine. I asked my friend Tom, and he won't have any cash for it, for at least another month. I got it for a steal ($100). I wouldn't be surprised, if I was the last person to use it. Hmmmm, maybe you and I should run on-the-air checks of it, when I get it, like we did with my TS-820.

Sounds good Ellen,
Next to the 520S, the 270 is my favorite rig. I get consistently good reports on audio.
I wouldn't mind finding another to play with!
Fortunately, the conditions on 40 will be improving soon as Fall approaches.
Let me know when you get it.
Bob

Hi All,
this morning, picked up a junker Trio TS520D - at casual glance, looks like a TS520, ie no warc bands, a few cosmetic differences - anything else of note about these? - its missing PA tubes, but from the 2 empty sockets in the PA cage, assume it uses 6146's. Is the Kenwood TS520 manual cloes enought to use? - just idle questions, its joined a long que of "junker" radios lying round the place...

520SE doesn't have sweep tubes. It has pretty much the same final layout
as the 820.

I'm not hearing anything on 14.283 right now. I managed to break a
pileup on 14.212 with an EA station on my first call, so I know I'm
being heard,
but the band is obviously funny today. I also discovered that I can't
hear anything with the computer on in my shack, so I have to work on
that issue. Hope to catch you later.

I backed off after a while also. 2 stateside contacts after calling several CQ's. Didn't hear any DX.
I have to turn off the power on my computer speakers otherwise I start coming through them. I moved the coax around a bit and it calmed down but not enough to stop the interference. Well take, thanks for giving it a try ...73 de KA2HHB

Rueben, I'm still on 20, was calling CQ on 14.283 but now a maryland contest station is taken over. Pick a quiet spot around 14.280 and let me know where you are. I don't want to switch to 40 yet, it's too noisy here.

Rueben, we're going to try 7.158, but even that is busy at the moment.
are you on 40? If you find a clear freq, holler and we'll try you there.

No, it's not just you. It's probably annoying, but a quirk of most
(some?) email clients.
BTW, I'm going to try 40 meters again about 0300 Z.

Kelly, where on 40 will you be? Maybe you could give a
frequency and say whether you'll go up or down from
there if you run into QRM/N.

Ken W8ASA

No, it's not just you. It's probably annoying, but a quirk of most
(some?) email clients.
BTW, I'm going to try 40 meters again about 0300 Z.

8711. Re: [TS-520_820_530_830] Re: Looking for 40 or 20m QSOs

It can be confusing, but usually the response is on the top anyway.
If you're speaking of the many emails today between myself and others it was
because we were trying to establish a QSO on 20 meters so we kept replying
using the original post.

No I was not referring to the number of messages trying to coordinate a qso. I'm talking about leaving a string of messages on the email.
I "try" to remember to strip off all the old messages. Makes it much easier for everyone else to read.

No, sorry - this is my first excursion into Kenwood gear in a serious manner - I have an 830 and a 440 but they have been easy to fix without having to scavenge bits from dead sets.

Like the way Kenwoods are built - relatively easy to work on, well documented.

Mainly been doing Yaesu FT200's, FT101's as a relaxation/hobby thing - so a few of them as spares boxes..... and other more modern radios when I am not fixing domestic stuff for a living - fix radios semi-commercailly in my "spare" (hah!) time.....

Been fixing up a TS520 for what seems eternity now - SO many faults, one after the other - its been restoration rather than repair. Final smoke test failed when bandswitch burst into flames on TX load test - havent had time to get back into into it, but picked up the Trio TS520D as a possible sapres source.....

What do you need - anything specific?

Andrew VK3BFA.

All,

AG4QP here, I am the owners of the station you see on the group homepage. I normally adhere to forum rules especially when they state "Please do not post "for sale" ads here." but hope y'all will make an exception. The entire shack, plus some newer£¬ post photo acquisitions, is up for grabs except for the ts-430 which needs some work before I sell it, most of the items are already or in the process of being listed on EHAM.net and QTH.com. If anyone is interested, drop me a line at ag4qp@.... Best wishes to all the "Glowing Kenwoods" aficionados.

Topic: 8717 Message: 8717

HI Gang,

Personally I like to see a bit of whatever someone is replying to; short memory here, a lot of groups and a lot of email to deal with.

We do need to trim them a bit however. I tend to get lazy and forget to do that sometimes.

On another subject, I have approved a couple of requests to post "for sale" items. I made the exception because AG4QP has allowed us to use a picture of his shack for the past year; also Ellen AF9J will be posting on a club radio for sale; Ellen is one of our moderators. Such are the perks!

Any questions, post me directly please.

Thanks and 73,

Bill K0ZL

Concerning RF UNIT - X44-1360-00 for Kenwood TS830S
I'm still looking for bypass capacitor C74 Kenwood # CK45E2H103P
Also L36 RF Choke Kenwood # L40-4711-03 . 470 uh piece.
Emailed Mouser but they never responded. Maybe I'll have to call them direct.

I'm using the info that was posted by Joan VK5KYO.
Sounds pretty much like my problem. I have receive but no transmit.
And prior to my shipping it out for repairs that never happened, I had no ALC, now
I see I have ALC but it's pegged to the right of the meter on key up. And still no power
output.

Also I was thinking about obtaining a gold electroplating kit, in order to 24K gold plate
the contacts on the bandswitch. Was wondering if anyone has tried that.

Just plugged both part numbers into the East Coast(kenwood) parts and
both are shown to be available.

8733. Re: Looking for 20m QSO's - Sunday - 1700 UTC - 14.273 +/- 5 kc

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-13 19:00:55 UTC
From: jimford80041
Topic: 8725 Message: 8733

Here is my report on activity:

14.273 turned out to be a bit crowded as there is a group at 14.275
with strong signals. Moved down to 14.272 and started calling. The
turn out was better than anticipated.

KI0KM called. Bob is running a TS-520S
KF6ZOL stopped by and chatted for quite some time.
Mike is running a TS-850S
K6KOI, John was using his Orion but also uses a tube gear,
a Swan 700cx.
WA5BDR said hello. Jim is one of the net control stations
for the Swan net at 14.251. He also uses a TS-120.
Today he was using his 700cx
N0FM jumped in to report he has a TS-570
KC0MKS was using a TS-520S.
W6FOG called in marine mobile from SanFrancisco bay,
on his Icom.

Ruben, I listened hard for you but did not hear much from the east.
The band really was very poor, lots of fading and noise. Of course,
Sunday is a very busy day for 20 meters.

The operation lasted about an hour before the band just completely
went to pot.

What a great time. The Kenwoods sounded great. I hope someone can do
this next Sunday.

Jim ... KG0PP

Real good Jim, happy to hear that you had a good time.
14.275 was a bit crowded but I left it on 14.273.
I seem to be picking up some noise on that freq. Could be my computer.
BTW I'm still there om 14.273 ....

Best 73...Ruben

I subscribed to this group to learn more about maintaining my classic Kenwood radio, not to read post after post about how someone can't make contact on 20 or 40 meters. May I suggest one of the instant messaging programs, a chatroom, or an IRC server for you guys so you can chat back and forth if you can't talk to each other on your radios instead of clogging my mailbox with a lot of messages I don't have to hit the delete key on?

Topic: 8725 Message: 8737

Hi Everybody,

Since I started this whole thing, I'll end it. As of this time. The whole net idea is put on hold. Propoagation, and QRM on 20m (and 40m for that matter) have made it a no go. Also, those of us looking for QSOs between each other, are getting a bit out of hand with posts to this effect. Some of us are looking into alternative means for connecting up with each other for Kenwood hybrid to Kenwood hybrid QSOs. Hang in there people. Many thanks to everybody, who gave the whole idea a try. :)

73,
Ellen, AF9J
Moderator - Kenwood TS-520_820_530_830

P.S. - just a little food for thought. Getting these rigs up and running, and keeping them running is cool. I can't thank people in this group enough for helping me to get my TS-820 up to snuff. Just remember, what is equally cool, is getting some use out of them too. They were made to be used, not just fixed up, and admired. Be cool everybody. :)

They have an 800 number Reuben. (800) 346-6873. You can order online and check the order status as well. http://www.mouser.com . You can even see thier catalog.

Ruben Echevarria <ka2hhb_2000@...> wrote: Concerning RF UNIT - X44-1360-00 for Kenwood TS830S
I'm still looking for bypass capacitor C74 Kenwood # CK45E2H103P
Also L36 RF Choke Kenwood # L40-4711-03 . 470 uh piece.
Emailed Mouser but they never responded. Maybe I'll have to call them direct.

I'm using the info that was posted by Joan VK5KYO.
Sounds pretty much like my problem. I have receive but no transmit.
And prior to my shipping it out for repairs that never happened, I had no ALC, now I see I have ALC but it's pegged to the right of the meter on key up. And still no power output.

Also I was thinking about obtaining a gold electroplating kit, in order to 24K gold plate the contacts on the bandswitch. Was wondering if anyone has tried that.

If such were the case, as to being a front end overload, I would seriously consider putting a static bleed resistor somewhere along those lines. It might help keep that from occuring again. That's one thing to consider, before you use that antenna again. it helps with static of nearby lightning strikes on larger antennas. It may keep this from reoccurring. I have one for my vertical out in the back yard. Static crashes can overload thefront end and may do damage too. Check your transmission lines are still good.
The other thong I suggest is check the AC voltage to the line is stable. It got my TS-830 once.
All that for the isolation from other sources. Making sure of these items isa good measure toward keeping a reocurrance to a minimum.
I must admit I have heard of liears on CB radios (even)mobile, damaging the CB's in other cars.
These measures I do suggest toward minimizing the reoccurance of any such issue. Now, yes, static is not normally such a big deal on a small antenna, but I have seen it occur on larger ones. It may help if a large amount of energy comes down the line again, no matter what the energy is.

Ellen,

You did a great job attempting to start a chat net for Kenwood vintage rigs. This Yahoo group has helped me tremendously in getting my TS-520/530 and TS-820/830 rigs running properly. The final measure of success is in putting the rigs on the air, which you attempted to organize.

There certainly other vintage nets on the air for Hammarlund, Collins, Swan, Drake, Heathkit, and other brands. It is time for a Kenwood net too.

The TS_520_530_820_830 board may not be the best place to make arrangements, but is all we have for now. I certainly do not want to give up on this project. Checking in to other vintage nets for the last three years with my Kenwood gear has been ok, but is not nearly as rewarding as meeting with other Kenwood users.

It was a pleasure to hear the other Kenwood folks on the air Sunday!

I apologize in advance to those who are offended by this posting.

Jim KG0PP

I think you might have a good idea there Reuben. It's a good mode to try and chase the net idea. A chat room may be just the channel to send some of the extra communications that don't seem suitable up here. Good place for the group to chase QSO's together too.

By the way. I got one TS-830 up last nite, finally. Thanks for the info for the person to try for a power transformer. I'll check into it.

I think you might have a good idea there Reuben. It's a good mode to try and chase the net idea. A chat room may be just the channel to send some of the extra communications that don't seem suitable up here. Good place for the group to chase QSO's together too.

By the way. I got one TS-830 up last nite, finally. Thanks for the info for the person to try for a power transformer. I'll check into it.

The transformer says LOI-8I06-15. I burned one of the 120 primaries with a power surge in the shack. They say that the same transformer was used in the 530 and the 830 and one other one but I'm not sure what it was. I'm guessing the 820.

Thanks Reuben. One of the tricks I found was to put the part number into a search engine and see what comes up. In your case I used Google. Then you just wander the pages till you find what your looking for.

See you at the chat.

Ruben Echevarria <ka2hhb_2000@...> wrote:
Thanks John, just trying to give it a chance. That's what it's all about.
I don't have a problem with the use of the room as a go between.
Hope you can find that xformer. I'm waiting for my new/used TS830S
to show up. Hopefully in a few days. I just ordered the parts that I was looking
for from East Coast Transistor. 1 Number has to come from Japan. But I can
wait.

Hey Reuben opened a chat room. For anyone interested, go down and check it out. It may be a good way to tie the net thing together or chase QSO's with each other. We got to meet each other down there. It worked very nicely and offeres a separate second channel of comunications for us. We even talked on mikes for a while. Go give it a try.

8761. Ts-820S No transmit/no alc/no drive/no output

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-15 15:42:43 UTC
From: Jack
Topic: 8761 Message: 8761

Hi Group. I've recently aquired a TS-820S. Seems to be completely functional on receive. Could use a slight alignment.

The transmitter section does not function. I have a slight difference in the transmit/receive frequency. I have adjusted the 9V and 3.3V on the AVC board. This has not changed the transmit display but the 3.3V adjustment did bring up the noise level a little and it seemed to zero the S meter under no signal.

I can get a 60 ma bias reading via the bias adjustment control on the back panel.

I cannot get any alc action when tuning the drive control. The meter is in the ALC position.

I Cannot get any Ip indication what so ever.

The 12BY7 and the S2001A tubes all check very good on my Knight 300 tube tester.

The SG control on the back of the radio is in the "ON" position.

I do not have an external VFO but do have pins 8 and 9 shorted on the vfo plug socket.

I checked R6 on the rectifier board and it checks ok. (it had been prefiously replaced.

I cannot find the current limiting resistor on the power supply board to check if it is open.

Any help would be greatly appreciated.

Thanks in advance.

Jack - KF4YIO

Hi Rob,

Try Jan Crystals. I've always gotten any crystals I've needed from
them. Here's their website:

http://www.jancrystals.com/

Click on the "Custom Crystals" line to determine what size you need.
At the bottom of the home page, they tell you how to order crystals
from them.

Hi Jack... It seems you have covered most of the obvious questions except one: have you checked the cathode resistors on the final board? There are two 10ohm in series and so you should get 5ohm across them. Both my kenwoods -- an 820S and an 830S came with bad cathode resistors. In neither case were they completely fried, but they were out of tolerance, and replacing them solved a problem much like yours.

8772. Re: Ts-820S No transmit/no alc/no drive/no output

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-16 00:53:22 UTC
From: Jack
Topic: 8761 Message: 8772

Hi Ron. Thanks for the info. I checked the 2 10 ohm resistors on the final board and get about 5 ohms on EACH resistor but get zero ohms across both of them. I made sure NOT to check the common side of the resistors.

Should they be replaced?

I also seem to have lost my bias voltage and in checking the voltage on the rectifier board, I get zero voltage on the plus side of either of the 2 electrolytic caps there.

Jack

Hi Ron;

In further checking, I seem to have lost my display and now the relay
does not operate. I have the feeling something is amiss with the
rectifier board.

Jack

Note: Resistors in "series": add the value of each one to get the total resistance.
Identical resistors values in "parallel": 2= 1/2 value, 3=1/3 value, 4=1/4 value, etc.

Pete, wa2cwa

Hi Jack. Well, I mistyped, as pointed out by Pete WA2CWA. The two 10 ohm cathode resistors are in _parallel_ and so you should read 5 ohms across the circuit. If you were reading them without desoldering them, which I assume you were, then the 5 ohms is good.

It sounds like you are zeroing in on the problem with the electrolytic caps, those are also known problems (but not known to me, I haven't worked in that area...yet).

That happened to me in the last week. I had no digital display no audio and couldn't key. I had just cleaned throughout the TS-830S including all switches because I had a feedback problem. I thought RF was getting into something somewhere. Here it turned out I forgot to put the SG Switch to "ON" for normal operation. The documentation doesn't really say this in the troubleshooting section. Off is just for neutralizing the tubes. Now I have one radio up and on the air.

Anthony alot of times you wind up replacing the whole coil too. Sometimes the slug won't move and someone forces it. What you see there may be that result. They usually crack. If that's the case, look at Ken's website W4EAA - Kenwwod restoration. He may be your best bet.

I put in a search on google search for you, and came up with this:
The electronics Seller BG Micro 1-972-276-9447 shows part No. COL 1038 as in stock for 39 cents. It seems like it should work. They deal outside the USA as well. It seems to be about the same size and shape as a 1/2 watt resistor. Check into it.

Also Arco Electronics on the web has a site that has a new dwvelopment in multi-layer ceramic construction, that may work for you. The capcitor voltage rating and capacity range are there in a smaller size that may fit just fine in your situation they fit mil specs. So check it out and let the rest of us know how you faired out.(800)441-2726.they're in Camarillo, California, USA.

Anthony,
If the cores are not Cracked, but just the tool slot is broken, you can carefully unsolder the coil from the board and unscrew the core from the bottom, then flip it upside down and screw it back in. The cores have the tool slot on both ends. Then resolder the Can onto the board. If the core is cracked, it will definately need to be replaced.

Jon, firstcheck your grid switch on the back to make sure it's turned on. Second replace those old tubes with some 6146's B's or W's. Cost around 40 bucks. Then neutralize the radio. Those tubes may be old, but something else may be going on. That's where to start.

Spray the contacts with some good tuner cleaner;both the band switches and the SW grid switch. move them both around and spray some more.This cleans the conections. When your done Make sure you move the SG Switch back to on.

Does anyone have info on the mod to use the DH button to select either the 1st IF cw filter alone, or both 1st & 2nd IF cw filters, while in the CW-N position? I seem to recall seeing this mod being published somewhere in the 1980's.

Jack:
Unless something has changed, I read that you can adjust the bias adjustment for 60 ma as follows:
In USB or LSB, mike gain fully down on transmit. Is this correct?
If so, Everything from a DC standpoint including the tubes in the final section is working.

I thought that I saw a post that said that you had lost your display. This can happen along with other deadness if the dummy plug is not installed in the VFO plug.
Also, be sure that the Function switch is straight up in the VFO position.

Please check to be sure that you have the proper fuse installed in this radio. Please read the article "Save your Transformer" near the bottom of the files section of this group.

Please tell us again exactly what the radio is and is not doing after checking the above.

Hi Ron. Thanks for the info. I checked the 2 10 ohm resistors on the final board and get about 5 ohms on EACH resistor but get zero ohms across both of them. I made sure NOT to check the common side of the resistors.

Should they be replaced?

I also seem to have lost my bias voltage and in checking the voltage on the rectifier board, I get zero voltage on the plus side of either of the 2 electrolytic caps there.

Jack

Cracked slugs are usually the result of somebody using the wrong or a metal tool to attempt adjustment.
Some coils are actually transformers, but the same things apply regarding jammed or broken slugs.
When trying to repair coils with broken slugs, patience and care is of the utmost importance. Remember that even if it takes considerable time to repair a jammed coil, it is insignificant compared to the time involved in trying to locate a replacement.

Often when slugs are cracked, the slot on the top is split and a corner of the top of the slug wedges the slug tight. Sometimes this chip can be removed with a small precision screwdriver and this will free up the slug. The slug then can sometimes be worked out from the top by carefully pushing on the corner of what is left of the slot with a very small precision metal screwdriver.

Like Gordon said, the coils can be carefully removed and the slug sometimes can be backed out from the bottom. If the slug cannot be removed from the top then carefully work from the bottom and then sometimes the chip can be released from the top by slightly moving the slug from the bottom. On the end where the slot is good, avoid using a metal tool as that is probably how they got cracked in the first place. As a last resort, try the metal tool very very carefully to get a firm grip but do not apply too much pressure or you will be in bigger trouble fast.

I have also found that sometimes heating the slug from the top or bottom with a small soldering iron helps it break loose.

As Gordon said, if the slug has one good end, smooth out any rough spots on the bad end and reuse the slug with the good slot up and of course use the proper plastic tool.

If nothing else works, after all else has failed, you can often CAREFULLY chip the slug out piece by piece using a small precision screwdriver and a small hammering device. I have even used a small drill bit and bored out the center of the slug. Start with a small bit and then use a bigger one until you can chip out the remaining slug. I do not use an electric drill for this. It will catch and destroy the coil entirely. I usually wrap masking tape on the shaft of the drill bit as a handle and use it as a hand tool. You will begin to feel like a dentist at this point. OUCH!

If the threads in the coil form or slugs are stripped so the slug will not stay in place, shim a very small piece of a rubber band next to the slug but be sure it is small enough that it does not make the slug too tight.

If you encounter a coil with some brown goop in the top, that is bees wax. It can be scraped out and melted with a small soldering iron. The coil slug can be turned while the wax is still warm. I usually do not reseal these coils as they don't move. The exception is VCO coils that were already factory sealed.

If the was must be replaced, you can often find excess wax adjacent to the coil or a good inexpensive source of bees wax is a commode seal available for less that 2 dollars at hardware or building supply stores.

Sometimes, these coils are sealed by a paint like substance. It can be melted or burned out using a small soldering iron.

Replacement slugs:

CB radios from that era are a good source of slugs as well as other consumer products from that era. The thread pitch and sometimes the diameter of the slugs varies. The CBs made by Cybernet such as Hy-Gains and Midlands, any CB that used a PLL 02A as a PLL chip is a possible candidate for Kenwood slugs. Most Uniden made units have slugs that are not the right thread pitch. Some Sears and JC Pennys radios also might have usable slugs. If you have a CB repair guy in the area that has been around for years, and his shop looks like a junk yard, he's the man!

The permeability of these slugs can vary but I have not very often had any problems changing slugs and disregarding this. There is usually enough range in these coils to compensate for this. Most of the slugs you will get will probably be found in the first IF of these rigs and they will be the correct permeability anyway. Although some from the PLL coil and transmit driver coils will work too. If the slug fits, try it.

If it ain't broke, don't fix it ! It is very very seldom that a coil or transformer that has not been tampered with after it was set at the factory will benefit from adjustment.

Hi Dan. Interesting that you mention this, as I have been looking at making a similar mod for my TS820. Here is the link:

http://www.radiomods.co.nz/kenwood/kenwoodts830.html

Note that the text in this page is not in the best shape, it looks like someone imported it through an interface and some letters and characters didn't quite make it. Since I was looking at doing a similar mod, I imported the text and edited it to the best of my understanding. The following is my interpretation of the section from the above page, with capital letters and corrections added. The normal disclaimers apply... If anyone sees any errors feel free to point them out and I will update my text.

73
--Ron
KC0TLN

Kenwood TS-830 filter modification

Here is an easy filter modification for the Kenwood TS-830s. First to use this mod, your rig needs the YK-88c and to make it even better, the YG-455c installed. In short what we are going to do, is move around a 9 volt switching voltage. This voltage comes from the AF board, connector no. 7, pin no. 5. It's marked RLR on the schematic. This voltage ends up at the PLL assembly, connector no. 8, pin no. VP2. Please don't try this modification by cutting in this circuit at the source, because this same switching voltage feeds the IF shift circuit, and the VBT circuit, and the PLL. So cutting the wire at the AF board will make the PLL unlock when the mode switch is anywhere but in the CW positions. Now to the procedures:

1. Remove the top and bottom covers, and turn the radio upside down with front facing you.

2. Locate the mode switch, and on the middle wafer set of contacts, cut the white wire with the blue stripe. It is located next to the terminal with no connection, on the middle wafer set of contacts. Leave about 1/4 inch of wire on the switch contact, so you can make a connection there later.

3. You will need a another switch, one with at least three terminals, with the center terminal always in contact with one or the other of the outside contacts. It's best to use a toggle type so you can mount it in

one of the spare holes on the back of the radio.

4. Splice into the wire removed from the mode switch, and connect this wire to the center of your new switch.

5. From one (you select) of the side terminals of the new switch, connect a wire and run it back to the mode switch. connect this wire to the terminal on the mode switch from which you removed the white wire with the blue stripe. You did leave that 1/4 inch of wire didn't you? Take care here, the grey wire next to the one you are working on carries 110 volts, so don't make any solder shorts!

6. Now from the remaining terminal of your new switch, connect and run a wire to the IF board to pins CW1-CW4. Connect this wire to the green wire, that is connected to one of these pins. You will then have two wires connected to one of these terminals.

7. Make sure that you have no solder shorts or bridges, make sure you have taped or insulated any bare wire connections. Mount the new switch in one of the spare holes on the back of the radio. Install the top and bottom covers.

The modification works great, one position on the new switch and everything is normal, in the other position the cw filter is placed in-line regardless of the position of the mode switch. To use the CW filters on RTTY/AMTOR I found I had to turn the IF shift control CCW to about the 9:30 position to center the tones in the passband. If you need an even narrower passband, just tighten it up a little with the VBT.

G'day Walt

Thanks for taking the time to post such a detailed reply,

it is much appreciated mate!

I will read your post over a few times before working on the radio!

I am just in the process of printing it up!

I know what you mean about if it ain't broke don't fix it, I bought a "dead" johnson viking 352D off e bay here in Australia some years ago as being parts only.

I have the service manual and some basic knowledge, so I spent about 6 hours all up tuning as per the factory specs, and guess what, it is the nicest sounding cb radio I have ever used (even though I no longer use that band much at all), just goes to show.

The guy I bought it from said that his tech could not get it going at all, very strange, sounds like he did more harm than good!

Thanks again mate

8798. Re: TS-830s, using DH button to select 1st & 2nd IF cw filters

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-16 23:55:27 UTC
From: dan_w7wa
Topic: 8789 Message: 8798

Thanks but that mod allows for using the cw filters in modes other
than cw. To clarify further, the mod I am looking for allows the
user in the CW-N position to use just the 1st IF cw filter (DH
button out) or use both the 1st and 2nd IF cw filters in combination
(DH button in). Thus this mod sort of provides a "CW-Narrow" and "CW-
Narrower" option.

Thanks for the help,Tried tuning today and and it worked but on the plate and drive tuning moving the knobs 1/32" could make it go completely through the tuning sweep,so I beleive it is the tubes that finally went south.
Thanks, Jon

Topic: 8761 Message: 8801

Hi Ken,

One source of 0.01uF 2kV disc capacitors in the UK is Farnell part number 921-660. I haven't looked at the circuit to assess suitability, but Farnell also have 150uH inductors in their catalogue e.g. 608-592 and 513-490. Farnell will accept credit card orders

Please note that the above part numbers are from the 2005 catalogue and are for components with lead-solder tinning. You will need to check their web site as these parts may have been replaced by lead-free parts which will carry a new part number.

73s,

Richard G3OTK

Hi John,

I don't think Dan was referring to the AM-mod, but I am most certainly interested in the AM-mod. Could you post the web address in the Links section? If not, an e-mail would be very much appreciated.

Tnx!

Hi, Allan= kb5doh here there is a friend who is a amateur who I feel would be a good member here he has a Kenwood a old 2-m needs a plug for it but really trying to get up grade to general and has to do the code. if you could send him a invite to the group would be nice. I have told him of the group, He was injured many years ago he has a broken neck and gets around in a motorized chair little to no use of hands/fingers. let me know what you decide please. He needs the power plug so that we can wire it for his radio to get it on the air. Uses a old small jones plug size less than 1" sq.

Allan Johnny kc5rvf@... is in Norman, OK

Review around page 60 to 62 of the service manual for the additional circuit board (relays, some discrete components, and a 6 KHz filter) that adds AM capability to the 830 and effectively makes it an 830M. Kenwood's comment to me years ago about adding this board was that it wasn't worth doing. 830S was designed with SSB and CW as the primary modes. If it was one of the CB AM mods that were floating around about 15 years ago, you might as well just take a hammer to the rig. Want AM, then go buy a pair of Kenwood Twins (599 series) or go buy a boatanchor rig.

FYI: The "DH filter mod" was published in the Kenwood User Group newsletter that was around back in the 80's through the early 90's. There was lots of great info on the 70's and 80's Kenwood rigs in those newsletters.

What did you actually find as the issue in the radio that caused the no transmit condition? I have one here that has the very same symptoms. Brad

Your right Peter, that person was doing 11 meter mods and adding AM to 25 watts. Advanced class liscence too. I should have looked into it further. Thank You.

When you pull the tubes to replace them, be careful about how you handle the parasitic chokes that connect on top of the tubes. and visually check all parts inside. I usually clean my PA while I am at it and oil the fan as well.

Have you ordered tubes yet? and are you going to run the radio by itself or with an amp?

8810. New Group Kenwood QSO

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-17 14:30:04 UTC
From: Walt Breining
Topic: 8810 Message: 8810

Kenwood QSO

Around a week ago, Ellen, AF9J came up with a great idea. We should get together on the air. Ellen tried a net and tried to get an informal rag chew going. Bit the force was not with her. There was a lot of interest in this but propagation was terrible.

Then another problem developed. People looking for each other created a lot of traffic on this site sending their frequencies and times back and forth. Ellen solved the problem by temporarily suspending this effort.

We have created a new Yahoo group to solve this problem. It is called Kenwood QSO.

This is a group for licensed Amateur Radio Operators to arrange for a QSO. It is intended for Amateurs to announce the time and frequency they will be on.

You must be a licensed Radio Amateur and a member of the TS-520_820_530_830 Group or the KenwoodMics Group to join.

Here is the URL. http://groups.yahoo.com/group/KenwoodQSO/

Vy 73, Ellen AF9J, Walt N9WB Co-owners.

Topic: 697 Message: 8811

Frank K2NCC, you can give the radio model to International Crystal Company in Oklahama City, and tell them what frequencies you want them to come out on and they will grind them to work.

I have bought several sets of repeater crystals from them over the years and they have all been right on the money, with one exception, and they immediately sent me another one.

You can call them and order over the phone. The have a data base on any kind of radio oscillator I think there is out there.

Hope this helps.

8812. Re: Ts-820S No transmit/no alc/no drive/no output

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-17 22:16:10 UTC
From: w5rkl
Topic: 8761 Message: 8812

Jack,

With zero output from the final your PA meter will not indicate any Ip current. There has to be RF output to indicate Ip current (final amplifier tube plate current). Without any output power from the RF amplifier final stage, there will be no ALC indication on the ALC meter position either. ALC is normally used with linear amplifier operation with the 820 through the 8 pin octical accessory socket on the rear. You will, however, have ALC readings "IF" there is output from the finals.

As for why you do not have output and the transmitter frequency is different than receive, providing your RIT is not turned on, the problem could be in the IF UNIT (X48-1150-00). I would suspect the output of the IF UNIT pin marked "TIF" is zero, no RF output. It appears that some mixing problems may also be a problem. Tracing the signal through until it disappears is the only way to find the problem area or component. A frequency counter placed on the "TIF" pin on the IF UNIT will show what frequency, if any, the 820 is transmitting on. The 820 service manual is a must have for doing this kind of troubleshooting.

73's,

Mike

I asked that same question to Tim Davidson about a year ago. He said it could be done, but the results would dissappoint me. The reason is the TS-830S would have to be retuned and I'd be disappointed with the results. So I droppred the issue of the new band. I'd rather have all the other bands and the 830 be reliable.

This is a waste of effort. One, you have to convert one band, most likely 75 or 160, two, you have to replace, rebuild, or retune, or all three, tuned circuits both on the receive and transmit side; three, how are you going to control the maximum 50 watt ERP for 60M with any of these rigs. A MARS frequency right outside an amateur band that exists on any of these rigs will work. The conversion to 60M on any of these rigs can be costly, value counterproductive, and most likely, will drive any resale value right down into the noise. A butchered up band on any of these rigs does not have much appeal.

8816. TS-820 part substitution

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-18 01:38:27 UTC
From: w5rkl
Topic: 8816 Message: 8816

Hello everyone,

I'm new to the 820 group. I've been a ham for over 40 years and presently I'm working on a TS-820S, no receive.

It all started with a failure of the final cathode resistors (R2 and R3 - 10 ohm 1 watt) on the bottom of the final board (X56-1200-00). It appears a previous owner had replaced the original 10 ohm 1 watt resistors with 1/2 watt 20 ohm resistors in parallel. Prior to the resistor's cracking, receive was excellent.

Once both resistors were replaced with the proper values and wattage along with a new set of matched 6146 final tubes, power was applied to the 820. Everything appeared fine except receive sensitivity appeared to be a bit low using the onboard calibrator signal. Keying the 820 using the front panel transmit switch was normal and final tube idle current was brought up to 60 ma with no ill affect. Drive control appeared good by varying the driver control as well as both transmit and receive display frequencies were correct. Unkeying the 820 went normal except in receive there was no longer any IF noise coming from the speaker and the calibrator signal no longer could be heard. The calibrator is working correctly as is the audio stage.

The power supply is working correctly as is all other stages except the receive signal isn't getting through the RF UNIT on receive.

The problem is in the RF UNIT, receive portion, and I believe one of the following DUAL GATE N Channel MOSFET transistors have failed. It's either Q2, Q3, Q6 or Q7.

Attempting to locate a suitable replacement has been a problem. For Q2 (3K35 (GR)) I believe I have found what appears to be a close match, an NTE221 DUAL GATE N-CHANNEL MOSFET. However, for Q3, Q6 and Q7 (3SK41 (L)), I'm having difficulty finding a suitable replacement.

Anyone have any ideas or suggestions where I can find a replacement for a 3SK41 (L)? Althought Q2 is similiar in construction, I do not feel it will work in Q3, Q6 and/or Q7's place, maybe Q3 since Q3 simply amplifies what Q2 gives it but not Q6 or Q7.

Thanks in advance for any assistance.

73's,

Mike
W5RKL

Mike, have you checked the 9v and the 3.3 volt circuits to be sure
they are adjusted correctly? Also, Check the diodes on the rectifier
board for the 14 V supply. Bad jojnts are common.
Next, I would check the connectors where they plug into the Rf board,
the AF-AVR board and the relay Boards.
Every 820 I have worked on, save one, has had bad terminals inside the
connectors. The other thing that comes to mind is possibly bad
contacts inside the Relay on the Relay Board. I had one 820 that had
multiple bad connector terminals on the Top of the RF board which gave
me very poor/ not at all, receive.
Make sure the Relay is working OK !

Hi Frank.

If you want to work 60M with one of the older rigs, you might consider one of the "general coverage" transceivers, and open up the transmit restrictions - which is usually a very easy modification to do. For example, I have a couple of Icom 751A's, that are opened up to transmit on all frequencies, that I use in my shop as test instruments when working on the older radios I play with. They cost about the same as the TS-830's, and you can operate on any band or frequencies that may be made available to the amateurs. This is a lot easier solution than modifying one of the Kenwood hybrids. For a couple of hundred dollars more, there are a number of the newer radios that could be purchased used to put you on 60M also. Not trying to discourage you from modifying the Kenwood, just pointing out some alternatives for you to get on 60M. Good Luck.

8819. My Newest Project TS-830S

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-18 02:59:06 UTC
From: Gordon
Topic: 8819 Message: 8819

I just received my newest project. I bought a TS-830S from a fellow that said he had a non-transmitting one he would sell. It arrived today via Fedex.
I plugged it into my transformer saver and turned it on. Everything lite up and it started receiving just fime. All the controls seemed to be pretty good except the ATT switch seems dirty. So, I shut it down, removed the transformer saver and plugged it back in. Then I turned it on and turned the heater switch on. So far so good. I checked the Idle current and it is at 65 ma, so I readjusted to 60ma. Ok, I switched to ALC and to the tune position. Right away the ALC deflected using the drive control, so I peaked it. Then I switched to cw and flipped the send switch, I peaked the Load and dipped the plate. Right away I noticed that peak output is slightly off from the plate dip. No big deal, just need to do so neutilization. So, I ended up with just over 100 watts out from a rig that was NOT supposed to transmit.
I then switched from the dummy load to the beam on 17 meters. I heard a fellow in CT calling cq. I gave him one quick call and he came right back to me. Gave me a 5/7 report with great audio. I gave him a 5/9. he was running 800 watts to a 5 element Quad. So, Now I am going to remove the covers, clean the controls and switches, blow out the Final Cage and then neutralize the finals. This 830 is probaly the most MINT looking 830 I have ever seen. It has two almost not noticable nicks and is super super clean. It even came with the External VFO-240 and the Narrow CW filter.

Mike;
The NTE222 is a replacement for the 3SSK41(L).

Subject: [SPAM] [TS-520_820_530_830] TS-820 part substitution

Hello everyone,

I'm new to the 820 group. I've been a ham for over 40 years and presently I'm working on a TS-820S, no receive.

It all started with a failure of the final cathode resistors (R2 and R3 - 10 ohm 1 watt) on the bottom of the final board (X56-1200-00). It appears a previous owner had replaced the original 10 ohm 1 watt resistors with 1/2 watt 20 ohm resistors in parallel. Prior to the resistor's cracking, receive was excellent.

Once both resistors were replaced with the proper values and wattage along with a new set of matched 6146 final tubes, power was applied to the 820. Everything appeared fine except receive sensitivity appeared to be a bit low using the onboard calibrator signal. Keying the 820 using the front panel transmit switch was normal and final tube idle current was brought up to 60 ma with no ill affect. Drive control appeared good by varying the driver control as well as both transmit and receive display frequencies were correct. Unkeying the 820 went normal except in receive there was no longer any IF noise coming from the speaker and the calibrator signal no longer could be heard. The calibrator is working correctly as is the audio stage.

The power supply is working correctly as is all other stages except the receive signal isn't getting through the RF UNIT on receive.

The problem is in the RF UNIT, receive portion, and I believe one of the following DUAL GATE N Channel MOSFET transistors have failed. It's either Q2, Q3, Q6 or Q7.

Attempting to locate a suitable replacement has been a problem. For Q2 (3K35 (GR)) I believe I have found what appears to be a close match, an NTE221 DUAL GATE N-CHANNEL MOSFET. However, for Q3, Q6 and Q7 (3SK41 (L)), I'm having difficulty finding a suitable replacement.

Anyone have any ideas or suggestions where I can find a replacement for a 3SK41 (L)? Althought Q2 is similiar in construction, I do not feel it will work in Q3, Q6 and/or Q7's place, maybe Q3 since Q3 simply amplifies what Q2 gives it but not Q6 or Q7.

Thanks in advance for any assistance.

73's,

Mike
W5RKL

Gordon, it sounds like you got a winner in the 830s. It good to hear if your good fortune.

Perhaps the previous owner never knew how to tune it up. I once knew an old gentleman that had plenty of money, bought a KWM2 transceiver. He took it home, kept it a while and someone asked him how it was doing (2 meter conversation) He said most bands it just doesnt work or put out anything. During that conversation the other gentleman asked him if he tuned it up on each band, how it responded. He said "Oh the fellow I got it from tuned it up for me just before I left his house with it" Poor guy never knew that it had to be retuned with some changes of frequency or bands. He never did figure it out, finally got rid of it. You may have one with the same past. (true story)

Some of them can figure that peak the drive and dip the plate, and some can't.

From: Jeroen
Topic: 8825 Message: 8825

Hi group,
I have an 830S in fairly good condition. When dipping the plate during tuning the rig into my dummy I notice quite a broad dip, not a nice narrow one. This makes dipping the plate not very easy. This happens on all bands. Tuning for maximum output with alternating plate and load on the other hand works very good. Max output into the dummy is approx. 100 W on the low bands and approx. 90 W on 10 meters. Do I have a problem, or is everything working fine?

It sounds ok to me so far. How old are the tubes? how bright is the filament? How hard were you driving it, was it in the ALC range on the meter, with the mic control set like it should? Your bias at 60ma.? The meter your using is it reliable on accuracy for the wattage your putting out? If all is correct, then Id say you have a good running radio. Don't drive it hard and you'll find it will last longer. Keep tunings quick too. My first radio when I first got it was like that. Good ALC for years. changed tubes a few times. this second one still is like that on certain bands into my full-size quarterwave. Maybe someone took good care of it or it wasn't used much or maybe it's been gone over and been cleaned and aligned. You probably have good tubes in there that are a good match and similar to what the radio originally came with combined with a good matching output. If your not sure you can try to neutralize the finals again, as the book says to do. but i'd say you got it on the sweet spot. Don't overdrive it and enjoy.

Subject: [TS-520_820_530_830] My Newest Project TS-830S

I just received my newest project. I bought a TS-830S from a fellow
that said he had a non-transmitting one he would sell. It arrived
today via Fedex.
I plugged it into my transformer saver and turned it on. Everything
lite up and it started receiving just fime. All the controls seemed to
be pretty good except the ATT switch seems dirty. So, I shut it down,
removed the transformer saver and plugged it back in. Then I turned it
on and turned the heater switch on. So far so good. I checked the Idle
current and it is at 65 ma, so I readjusted to 60ma. Ok, I switched to
ALC and to the tune position. Right away the ALC deflected using the
drive control, so I peaked it. Then I switched to cw and flipped the
send switch, I peaked the Load and dipped the plate. Right away I
noticed that peak output is slightly off from the plate dip. No big
deal, just need to do so neutilization. So, I ended up with just over
100 watts out from a rig that was NOT supposed to transmit.
I then switched from the dummy load to the beam on 17 meters. I heard
a fellow in CT calling cq. I gave him one quick call and he came right
back to me. Gave me a 5/7 report with great audio. I gave him a 5/9.
he was running 800 watts to a 5 element Quad. So, Now I am going to
remove the covers, clean the controls and switches, blow out the Final
Cage and then neutralize the finals. This 830 is probaly the most MINT
looking 830 I have ever seen. It has two almost not noticable nicks
and is super super clean. It even came with the External VFO-240 and
the Narrow CW filter.

Gordon

Allan
The manual is available at
http://kb2ljj.serveftp.com/kenwood/AT-230_Schematic.pdf
It contains schematis which show what pins to connect to if you have
to rewire a different connector.
Also I note that this is NOT a Kenwood Hybrid

Hi Allan. You might try Radio Shack. Don't know if you are looking for a 2 pin or 4 pin connector, but sometimes RS has these in their flat drawer component files. Sometimes they can order things they don't have in stock and have it shipped direct to the customer. You might try Mouser or Antique Radio also.

hi,

while you are inside the radio, try cleaning the
tx/rx relay with some Deoxit on a business card
even if the contacts look clean.

I did this after reading a post from Pete, wa2cwa
and that cleared up the receive problem.

If your loading control is set too high, the dip will be less pronounced. With start of plate and load tune up, loading should be set to extreme counterclockwise position to determine "first" dip. After first dip, loading control can be advanced further clockwise. The closer you get to max. output, the less pronounced the dip will get.

I've heard that too. But I've used both without a problem. They say you can use the w's which are high dissipation tubes with an amplifier at a reduced output.. I use B's since I run both with and without amp. As for stealth antenns, I've run wires and such over the years. I just made a stealth full size quarter-wave on 40. It's in the open yard and you can't see it from the road, until you round the house into the back yard. The neigbors didn't know for a week it was there, they've never heard me on clock radios, TV's or phones or computers. I can remove it and it fits the CC&R and local zoning regs. I got neighbors you can see window to window just about. my back yard has a 70 by 70 area that is open and contains the whole antenna system. Yes, I run an amp. It only affects one touch lamp in our house and as soon as I move off that circuit that will disappear. It's just a voltage drop issue. Something to check out.

jon_77449 <jledbetter8@...> wrote: I'll not be running an amp because I'm trying to setup stealth
antennas such as slinky type dipole in the attic. I have not ordered
tubes yet,budget's a bit tight right now. I've read the GE brand
6146w's are not recomended in kenwoods,is this true or has anybody
used them?

OK, this is new to me. Thank You, and how is that adjusted?

Peter A Markavage <pmarkavage@...> wrote: If your loading control is set too high, the dip will be less pronounced.
With start of plate and load tune up, loading should be set to extreme counterclockwise position to determine "first" dip. After first dip, loading control can be advanced further clockwise. The closer you get to max. output, the less pronounced the dip will get.

I ask a while back but I receiveid no responce, Is there anyone on the board that has used a Internatinal radio crystal filter made in Newport Richie, Fl. I have one in a Ts 530sp that I would like to have some infomation on or paper work to. It is mounted on a small board and uses a preamp " I think" it is wired in on the I.F. board. I would like to move it to the narrow Filter slot, and it is a 2.1. Right now it is run in series with the 2.4 factory filters it works fine, But a bit narrow at times. any help would be greatly appreceited.

8851. TS520 with single final, 12 volt conversion RCA 6883 SDA tube, help?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-19 05:22:11 UTC
From: m_m_maxau
Topic: 8851 Message: 8851

G'day guys

I Just grabbed a really rough old, but working TS520 and it runs the 12 volt final conversion, no 6146b's, but only one 6883 SDA tube.

Bottom line is that I need a new final tube, anyone able to sell me one or tell me where I can get one in Sydney?

I would like to keep the old beast running as, even though I bought it for parts, I cannot bring myself to destroy a working TS520 !!!!

Thanks

Hi Perry,

That is a 8.830 mhz. discrete crystal filter that is daisy chained in with your stock YK-88S ssb filter. The filter has ~6db loss and the lttle amp on the board compensates for this. This was done to increase the selectivity by adding the 8 pole filter along with the stock 6 pole one. You can pull it out of the circuit but you will have to jumper between where the input and output wires are tied in.I had one in a TS-530S back in the mid 80's... If I remember right (and this was over 20 years ago) I had to cut a trace on the board to insert the filter board in the I.F. chain... To add it in your narrow filter slot, you will have to use RG-174 coax and make short runs from the I.F. board to the filter and use double sided sticky tape to mount filter nearby. Remove the filter from the board when you do this. The Inrad filter is much larger than the stock YK kenwood filters. Make sure you isolate the + leads to the filter with .01uF ceramics as the radio will see a dead short otherwise.

Hi Dave,
I'm pretty sure the gentleman knew how to operate the rig. He is the Original Owner and even sent me the original warranty card. he purchased the radio on October 9th, 1983. He installed the 270hz CW filter in 1983 and made DXCC with the rig.He told me that it had no idle current either, so I am wondering if he had just not turne the heater switch on or something. I am happy that it works so well and looks so good. I might just make this one a Keeper. The VFO-240 cable somehow got lost in shipping, but he is going to look again to see if it got left on his Bench by mistake.
Yep, I'm a HAPPY guy with this purchase. :-)

73,
Gordon

> Perhaps the previous owner never knew how to tune it up. I once knew an old gentleman that had plenty of money, bought a KWM2 transceiver. He took it home, kept it a while and someone asked him how it was doing (2 meter conversation) He said most bands it just doesnt work or put out anything. During that conversation the other gentleman asked him if he tuned it up on each band, how it responded. He said "Oh the fellow I got it from tuned it up for me just before I left his house with it" Poor guy never knew that it had to be retuned with some changes of frequency or bands. He never did figure it out, finally got rid of it. You may have one with the same past. (true story)

You might want to drop N8RT, Robert Pohorence, an e-mail. He's listed up on QRZ with his bio which includes the start of International Radio back in the 80's. Maybe he still has some info floating around.

I was referring to the plate tuning control. You said it could be adjusted for deeper dip. I had never hreard of it and figured I'd inquire. I have an two 830S. My one is down and the other doesn't dip as well sometimes and others it dips quick and sharp.

8865. speaking of a good dip.....

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-20 12:41:40 UTC
From: scott
Topic: 8865 Message: 8865

Hi to the group, I have a ? about dipping the plate, when I tune on 40 meters, I don't get much of a dip at all. I have good output, (about 125 watts on MFJ tuner's meter), and all the readings in the various positions as outlined in the manual are as they should be. I was wonering if the dip gets more pronounced as the freq. gets higher. I don't move off 40 too much, I suppose I could tune the different bands, but would like some feedback from more experienced users. This is a TS-520S by the way. I follow the tune up sequence exactly but it seems to me that I got more of a dip on my FT-101ZD, but that was 6 years ago so I'm not sure. Thanks for any replies and info. cheers scott. KG6BRG.

8866. Re: [TS-520_820_530_830] speaking of a good dip.....

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-20 13:52:03 UTC
From: David Rust
Topic: 8865 Message: 8866

Scott, there are some variables in that dip thing. Sometimes it depends on where the Load control is set. If you have an inline watt meter or swr bridge you might take a look at the output swing on the meter there. I wouldn't worry about it, so its dipped and not getting excessively hot.

I have noticed some bands are more pronounced than other on the plate current swing. I had an old Viking Valiant that was touch as heck on some bands and others pretty lazy acting on the dip.

I'd like to report for those that know him:
John Kakstys W2FNT is at the Veterans Memorial Home – Menlo Park.
Most Hams from the New Jersey, New York, Connecticut area I'm pretty sure
know who John is. A great guy. He's helped many a new ham as well as old timers.
I've known John since the mid 70's. Purchased lots of gear from him. This is a
guy that always stood behind all of his sales. His word was gold. Truly honest.
I was recently shocked when I called his house looking for him and was told by
his wife that he was at the VA Home in Menlo Park.
Currently I'm trying to get more information.
At the same time trying to respect their privacy.
I'm sure he would appreciate a get well QSL card or just a get well card from his friends.

Ok here is the latest info: John Kakstys W2FNT
V.A. Memorial Home – Menlo Park

Howdy
I recently found a screamin' deal on my TS 830 S, got it with the AT 230 for $75 both in the original boxes. It had been sitting on a shelf for quite a number of years. I had to go in and wiggle all the connectors inside, but everything seems to be working like new now (knock wood). Both units look like they had never been out of the box. The WARC bands had not even been opened up. Thanx to this group I found the right wire (not 2 as the manual says) and rather than cutting (again per manual) I was able to get the contact out of the connector and tape it off. This leaves the possibility of putting it back into the condition in which it originally left the factory. So far I have been nothing but happy with this radio. Have worked all the bands except 160, have to put up another wire for that one (soon!).

From: Peter A Markavage
Topic: 8825 Message: 8873

Probably no need to rehash the entire dip and load procedure since it's documented in Section 4 of the 830 operating manual and also on the "files" section here. Things to remember; the load tuning is on the antenna side of the tank coil whereas the plate tuning is on the plate side of the tank coil. You normally want to have the minimum amount of load capacitance to the antenna for maximum output at plate tank resonance (the dip). A quick look at the various tuning procedures don't document where the initial setting of the load control should be. If you start your tuning procedure with the load control set to high, adjusting the plate tuning control for dip may not bring about a very discernible dip (or may appear to be a "wide" dip) in the plate current, because you may be already near, or gone beyond, the setting for correct load capacitance to your antenna or dummy load (or whatever you're loading the transmitter into). If you're going to do "dip and load procedure" you should always start with a minimum amount of load capacitance to determine the initial dip. Then, increase the load control a few degrees and dip again; then increase the load again and dip again, etc. until you reach the maximum plate current spec. for the rig or the maximum plate current you want to use. As you move higher and higher with the plate current scale with this procedure, "the dip" will become less and less pronounced. When you reach a point where you no longer can see "the dip", you have reached maximum or have gone beyond the correct load capacitance. If you desire to keep your rig and final tubes with long life, you will want to stay below this point.

8875. Line Voltage Fluctuations

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-21 02:52:43 UTC
From: DW
Topic: 8875 Message: 8875

Hi gang,

Does anyone have any experience with abnormal
fluctuations in the AC main voltage?

Here's the basics. I live in an apartment built in
1962. Currently, on average, we blow a light bulb
every two to three days, including GE, Sylvania, &c.
By this I meanwhile lit, not when switched on.

Landlord brought in an electrician, who said line
voltage is bouncing from 100-140VAC. No problems with
any household electronics, & I run my 2M, scanner, &
SW rcvr off of a gel cell W/ a trickle charger.

I plan to set up my TS520, but wanted to go through
the mains rather than pull that much amperage from the
12V system. Anything unusual I should be looking for,
or doing differently other than toroids, groundstraps,
&c. I'm concerned that a high V spike could fry this
thing, which will be my primary HF rig.

Thanks,

hi DW,

100-140vac is a big swing, no wonder you're loosing lightbulbs.

I'd give the electric company a call, based on the age of your
building, I bet some equipment needs to be replaced.

If you can find a nice used full sinewave ups, that will help keep
the kenwood from blowing the tube filiments.

Or a powerline conditioner will do the job but are more expensive.

note the regular computer type ups are not full sinewave and
are not intended to be used with transformer equipment.

Hello,

Yes, I have experience with what you describe with the voltage fluctuating...Mine turned out to be a ground fault! You have 240vac coming into the main fuse panel and it is divided into 120vac on each side. If you do not have a good ground on the power coming into your building your voltage will fluctuate between the two legs. It will still total 240vac but one leg might be 160vac and the other 80vac. If it is a ground fault, this can be very dangerous. In our case, it burned up a television and a toaster got hot enough to melt the heating elements. The circuit braker tripped. The problem turned out to be a corroded ground connection on the transformer coming into our house. It let the voltage 'float' Have somebody do more than just check the AC voltage.

Does anyone in the group have an AT-230
they want to part with? I've been trying
to find one is excellent condition, but
the ones on E-Bay seem to be fetching
too much money. My TS-830S needs a better
tuner than the MFJ-949E I'm currently
using, and the XYL is beginning to comment
on how well-coordinated the shack looks.

So far, I have the matching station monitor,
speaker, and external vfo.

I'm soon to be the owner of a TS-570S(G) so
I can work six meters once it starts opening
up again. I tried and tried to get a
Kenwood transverter to no avail.

Thanks,
Ken W8ASA

AT the very least, invest in some varistors. They're $1.50 or less and they'll clip the voltage spikes. You can make your own distribution panel for the Ham gear and add the varistors there. Be sure to add fuses to the panel. A varistor act like a capacitor until the voltage spike comes along and then it acts like a resistor. A sustained spike might draw too much current and act like a short. The best course is, of course, to find and eliminate the reason for the spikes. Sometimes that's just not possible. My Dad lives out in the country and kept losing small appliances (mainly bread machines) due to voltage spikes. We added varistors to the outlet and the problem went away.

Why not try a computer ups and surge suppresser and
run TS530 off that. That should take care of any over
and under voltage problems.

Please tell your landlord to CALL THE POWER COMPANY!!

This is a very dangerous situation, and the
power company needs to correct it immediately.

The landlord's electrician should have known
to call the power company. With a possible
ground fault, they usually respond very quickly.
At least around here they do. YMMV.

I believe a floating neutral or a neutral above ground could result in death if you were handling something like a metal toaster, etc. If you become the ground thru some metal grounded object, I would think that's the end of the line??
Am I thinking correct?

The correction was already done. This was over a year ago. It was the power companies side. The damage was already corrected. The settlement for the damaged items is already paid. They had a floating neutral at the pole. The old wire was replaces and since then the sevice going down the road has been upgraded. So far it's been a little quieter too. The old service was being a problem once a year. But when the new housing development went in down the road, the service was upgraded.

Well that's what I'm trying to get to next. For a while I also ran of another more reliable line. Now that i've corrected a problem with the line to the shack (which is outside the house) I'm watching for more problems with the power fluxuating. One of the things I also did was to run 220 for the linear to the shed also. outlets have now been installed and some insulation has been put in the walls for the winter, as well as improvements to the entry point such as better ramps including an abrasive painted surface for better traction to walk on for the winter. Just to get the station moved out of the house was a major task.

Sherrill Colford <spudcol@...> wrote: Why not try a computer ups and surge suppresser and run TS530 off that. That should take care of any over
and under voltage problems.

well that's the point I was making Randy in the previous E-Mail I wrote. The wiring has been updated. Moving the radio station has been a major undertaking but has also been a major step in the right direction. For example: I no longer bother anybody with noise or the TV isn't interfered with now. The noise floor has dropped tremendously. It's so much more quiet now. The new ground is less only about 6 feet long made of 3 inch copper strap to it's own ground rod. The upgrade of the transmission line has helped greatly. The new antenna has made getting a signal in and out much better. Now I don't run on extension cords. There's 220 for the Amplifier instead of running it on 120. the neighbors no longer hear me at all, and they are alot happier with my new antennas. I'm not an eyesore. I'm invisible. Now I will build a new power bus for the new radio bench complete with just like you said, "varistors". There's already circuit breakers and the staion is on it's own breakerbox
all by itself. building the ground mounted vertical with 56 radials in the ground and running the 1/2 inch hardline has been a very time consuming task. I haven't even made the beverage yet.

I've worked alot of overtime these last couple of years to pay for this goal combined with alot of work done here on the property to add to the list. It only goes so fast. That radio has been down a year now, and a second one has been in it's place for about six months. a remote VFO added. The keyer was replaced too. It only can be done so fast.

Randy Morton <ke5eot@...> wrote:
AT the very least, invest in some varistors. They're $1.50 or less and
they'll clip the voltage spikes. You can make your own distribution
panel for the Ham gear and add the varistors there. Be sure to add fuses to
the panel. A varistor act like a capacitor until the voltage spike comes
along and then it acts like a resistor. A sustained spike might draw too
much current and act like a short. The best course is, of course, to find
and eliminate the reason for the spikes. Sometimes that's just not
possible. My Dad lives out in the country and kept losing small appliances
(mainly bread machines) due to voltage spikes. We added varistors to the
outlet and the problem went away.

8891. Re: [TS-520_820_530_830] VFO-240 Cable

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-21 18:27:34 UTC
From: Bill Scurlock
Topic: 8867 Message: 8891

Hi Gordon.

I researched the schematics for the TS-830S, TS-530S, VFO-230, and VFO-240 regarding the cable for a remote vfo. I believe you are correct in that the pins appear to be wired direct pin-to-pin on each end of the cable. Here is what I found for the 8 pin remote vfo sockets on the radios and on the VFO's.

Pin 1 - the "hot" Remote VFO signal going to the PLL Unit connector 6 pin 1 (TS-530S). Note that the radio internal VFO signal goes to connector 5 pin 2 (PLL Unit).

Pin 2 - Identified as "RL" going to the AF Unit connector 6 pin 6 (TS-530S). Also identified as "RL" in the VFO-240 and VFO-230.

Pin 3 - Identified as "9" (volts?) going to the AF Unit connector 6 pin 7 (TS-530S). Also identified as "9" in the VFO-240 and VFO-230.

Pin 4 - Identified as "RLC" going to pin 1 of the VFO Assembly X60-1150-01 plug of the internal vfo (TS530S). There is no connection to pin 4 for VFO-240, but there is a connection in the VFO-230.

Pin 5 - Identified as "VFB" going to pin 3 of the VFO Assembly X60-1150-01 plug of the internal vfo (TS-530S). The connection to this pin 5 for the VFO-240 is identified as "MCO". In VFO-230, this signal is identified as "VFB".

Pin 6 - Identified as "0.5" going to the Counter Unit X54-1540-00 connector 1 pin 2. There is no connection to pin 6 for VFO-240, but there is a connection in VFO-230 identified as "5.00".

Pin 7 - This is a ground connection used to shield the "hot" vfo signal lead.

Pin 8 - Identified as "12" in the TS-530 and goes to several places including the Counter Unit connector 1 pin 3, and the RF Unit connector 6 pin 2. In VFO-240 this signal is identified as "14" and provides power to PL1 and PL2. There is no connection to this pin in VFO-230.

I used the interconnection/schematic diagram for the TS-530S for the above references because Kenwood drew it line-for-line , whereas the TS-830 diagram draws one line for multiple conductors where you have to follow all the "breakouts" to figure out where the conductors are going which is a little more time consuming.

It appears that you can use a 6 conductor cable if you only plan to use the VFO-240, or a 7 conductor cable if you only plan to use the VFO-230. But if you plan to use the same cable for either VFO, then you will need to use 8 conductors. The VFO-240 is made to use with either the TS-530S or TS-830S.

This was an interesting exercise. Maybe it helped you a little.

73, Bill, K5GCW

Topic: 8825 Message: 8896

Thank You.

Peter A Markavage <pmarkavage@...> wrote: Probably no need to rehash the entire dip and load procedure since it's
documented in Section 4 of the 830 operating manual and also on the
"files" section here. Things to remember; the load tuning is on the
antenna side of the tank coil whereas the plate tuning is on the plate
side of the tank coil. You normally want to have the minimum amount of
load capacitance to the antenna for maximum output at plate tank
resonance (the dip). A quick look at the various tuning procedures don't
document where the initial setting of the load control should be. If you
start your tuning procedure with the load control set to high, adjusting
the plate tuning control for dip may not bring about a very discernible
dip (or may appear to be a "wide" dip) in the plate current, because you
may be already near, or gone beyond, the setting for correct load
capacitance to your antenna or dummy load (or whatever you're loading the
transmitter into). If you're going to do "dip and load procedure" you
should always start with a minimum amount of load capacitance to
determine the initial dip. Then, increase the load control a few degrees
and dip again; then increase the load again and dip again, etc. until
you reach the maximum plate current spec. for the rig or the maximum
plate current you want to use. As you move higher and higher with the
plate current scale with this procedure, "the dip" will become less and
less pronounced. When you reach a point where you no longer can see "the
dip", you have reached maximum or have gone beyond the correct load
capacitance. If you desire to keep your rig and final tubes with long
life, you will want to stay below this point.

Do not put your 530 on that voltage fluxuation. It'll wind up like my 530 did. Get the power fixed first. Then use a good ground and put UPS or at least some varistors on the power going in. I wound up buying another radio till I get this one fixed. It's cheaper to correct the problem first. Mine it turned out to be the electric company and they replaced the answering machine, the TV, the Microwave the Refrigerator and all the other stuff by a check six months later in a settlement, after we paid for an electrician to determine where the problem was. Turned out the problem was at the pole on the road. It started out like yours did. blown light bulbs and the lights changed brightness. It's a fire hazard too.

DW <andersonradioactivity@yahoo.com> wrote: Hi gang,

Does anyone have any experience with abnormal
fluctuations in the AC main voltage?

Here's the basics. I live in an apartment built in
1962. Currently, on average, we blow a light bulb
every two to three days, including GE, Sylvania, &c.
By this I meanwhile lit, not when switched on.

Landlord brought in an electrician, who said line
voltage is bouncing from 100-140VAC. No problems with
any household electronics, & I run my 2M, scanner, &
SW rcvr off of a gel cell W/ a trickle charger.

I plan to set up my TS520, but wanted to go through
the mains rather than pull that much amperage from the
12V system. Anything unusual I should be looking for,
or doing differently other than toroids, groundstraps,
&c. I'm concerned that a high V spike could fry this
thing, which will be my primary HF rig.

Thanks,

DW White KE6WYB

Cogradulations on your catch there George. Now come on out and be my first QSO for WAS with that equipment. See you on the air. Nice work.

George W7ZVD <w7zvd@...> wrote: Howdy
I recently found a screamin' deal on my TS 830 S, got it with the AT 230 for $75 both in the original boxes. It had been sitting on a shelf for quite a number of years. I had to go in and wiggle all the connectors inside, but everything seems to be working like new now (knock wood). Both units look like they had never been out of the box. The WARC bands had not even been opened up. Thanx to this group I found the right wire (not 2 as the manual says) and rather than cutting (again per manual) I was able to get the contact out of the connector and tape it off. This leaves the possibility of putting it back into the condition in which it originally left the factory. So far I have been nothing but happy with this radio. Have worked all the bands except 160, have to put up another wire for that one (soon!).

Bring it up and load it carefully into a dummy load. See what it does. the manual is there with it isn't it? If the radiolooks clean inside and the fan is lubricated, You should be in for a pleasant suprise at using this radio. You'll soon find out why this is a favorate.

Scott, my one 830 is the same way as David's. I often wondered till today if it wasn't my antenna. It loads differently at various bands and even frequencies. Like 10 and 160. They are wide bands and require alot of retuning. I know what you mean, sometimes I say the same thing. I just learned to record my settings to be close to where I want.

David Rust <dlrust@...> wrote: Scott, there are some variables in that dip thing. Sometimes it depends on where the Load control is set. If you have an inline watt meter or swr bridge you might take a look at the output swing on the meter there. I wouldn't worry about it, so its dipped and not getting excessively hot.

I have noticed some bands are more pronounced than other on the plate current swing. I had an old Viking Valiant that was touch as heck on some bands and others pretty lazy acting on the dip.

Hi,

Unless the computer ups is full sine wave, the radio
will not like the ups. these inexpensive ups systems are
designed to run equipment with switching power supplies.

a surge strip will be just a bandaid until the mov(s) in the
strip fail and provide no protection.

if the batteries are removed from the ups and it is used as
a power conditioner, the 140 vac will be out of the range of
the unit and will changeover to battery power.

your correct, very dangerous to have neutral lifted, in the aforementioned comercial building it tripped a 3000 amp breaker on the ground fault, plunging the entire 5 story building into darkness. at least we have some protection, but the power company has nothing to do with the internal wiring of the building, they stop at the meter or transformer. ron ne0x

8909. TS-820S update

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-22 01:41:34 UTC
From: w5rkl
Topic: 8909 Message: 8909

Good evening everyone,

I've had some time to look further into my 820S problem. After checking all the voltages they all were well within specifications including the 3.3 and 9 VDC.

The 820's display is now showing signs of instability from either the PLL, VFO or hetrodyne oscillator boards. The right 3 digital display numbers are changing at random. Following the signal path from antenna to speaker, using an o'scope, checking the input to and output from, RIF and TIF on the IF UNIT, shows instability. The signal displayed on my freq counter changes as the band switch changes but the 100 khz values are very unstable, constantly changing.

I've seen a similiar problem before, instability in the digital display. I know it's not the fix but cleaning the VFO variable capacitor tension spring capacitor frame contact brought the 820 back to normal operation. However, this time, I cleaned it again, twice, but no change. What I have noticed is, switching the mode switch through it travel both ways and/or the function switch through it's travel, both ways, did cause the display to settle down. However, simply turning either the function switch, any direction, or the mode switch, any direction, caused the 820 to, again, become unstable. Even though there was some brief stability, there still was nothing being received nor could I hear normal receiver noise or the calibrator or 5 mv peak to peak signal injected at the antenna connection.

Attempting to take voltage readings at various points on the circuit boards is difficult. First, the voltage readings on the schmatics are difficult to read. Second, output frequencies from the various boards are not given or shown on the schematic. The "troubleshooting" chart is useless to say the least. I doubt the digital display unit is the cause since unplugging it does nothing, other than make an 820S become an 820 and the digital display no longer shows up. Yes, pins 8 and 9 on the rear 9 pin socket are shorted to allow the internal VFO to work without the VFO 820 plugged into that socket.

Thanks and 73's

Mike
W5RKL

8910. TS-520S, No WWV reception

Thank You ALL very much for replying. I really
appreciate it.

Discussed the situation with the landlord. I don't
think they'd care unless the building burned, & that
would probably be a windfall for them. I'm sure that
you all know the type.

I've notified the power company, & they're going to
check it out. They're concerned particularly because
all lines, transformers, & insulators on my street
were replaced in the beginning of June. If it turns
out to be a neutral problem within the building,
they'll be notifying both the property owner & the
housing department as SOP, so hopefully I'm in a
win-win for once.

Thanks again everyone.

Back to my corner again.

8912. RE: [TS-520_820_530_830] VFO-240 Cable

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-22 06:52:00 UTC
From: Richard Harris
Topic: 8867 Message: 8912

Hi Bill,

I made up a cable for my TS-530 and VFO-240 some time ago. I can confirm that it is pin to pin. I used a length of Belden 9903 10 Base 5 cable - this has four screened twisted pairs within an overall screen and is a data cable - there other similar cables available..

As you will know, the connectors are 8 pin DIN audio-style connectors. Beware - there are two types of 8 pin DIN connectors with slightly different pin spacing. I didn't know this and the first cable that I made up used the wrong type, so I damaged the socket on the VFO - fortunately this is easily replaced, unlike the one on the transceiver that has a switch attached to sense when the VFO cable connector has been plugged in.

I believe that the schematic that I drew for the cable may be in the files section of this group.

73s,

Richard G3OTK

Subject: Re: [TS-520_820_530_830] VFO-240 Cable

Hi Gordon.

I researched the schematics for the TS-830S, TS-530S, VFO-230, and VFO-240 regarding the cable for a remote vfo. I believe you are correct in that the pins appear to be wired direct pin-to-pin on each end of the cable. Here is what I found for the 8 pin remote vfo sockets on the radios and on the VFO's.

Pin 1 - the "hot" Remote VFO signal going to the PLL Unit connector 6 pin 1 (TS-530S). Note that the radio internal VFO signal goes to connector 5 pin 2 (PLL Unit).

Pin 2 - Identified as "RL" going to the AF Unit connector 6 pin 6 (TS-530S). Also identified as "RL" in the VFO-240 and VFO-230.

Pin 3 - Identified as "9" (volts?) going to the AF Unit connector 6 pin 7 (TS-530S). Also identified as "9" in the VFO-240 and VFO-230.

Pin 4 - Identified as "RLC" going to pin 1 of the VFO Assembly X60-1150-01 plug of the internal vfo (TS530S). There is no connection to pin 4 for VFO-240, but there is a connection in the VFO-230.

Pin 5 - Identified as "VFB" going to pin 3 of the VFO Assembly X60-1150-01 plug of the internal vfo (TS-530S). The connection to this pin 5 for the VFO-240 is identified as

"MCO". In VFO-230, this signal is identified as "VFB".

Pin 6 - Identified as "0.5" going to the Counter Unit X54-1540-00 connector 1 pin 2. There is no connection to pin 6 for VFO-240, but there is a connection in VFO-230 identified as "5.00".

Pin 7 - This is a ground connection used to shield the "hot" vfo signal lead.

Pin 8 - Identified as "12" in the TS-530 and goes to several places including the Counter Unit connector 1 pin 3, and the RF Unit connector 6 pin 2. In VFO-240 this signal is identified as "14" and provides power to PL1 and PL2. There is no connection to this pin in VFO-230.

I used the interconnection/schematic diagram for the TS-530S for the above references because Kenwood drew it line-for-line , whereas the TS-830 diagram draws one line for multiple conductors where you have to follow all the "breakouts" to figure out where the conductors are going which is a little more time consuming.

It appears that you can use a 6 conductor cable if you only plan to use the VFO-240, or a 7 conductor cable if you only plan to use the VFO-230. But if you plan to use the same cable for either VFO, then you will need to use 8 conductors. The VFO-240 is made to use with either the TS-530S or TS-830S.

This was an interesting exercise. Maybe it helped you a little.

73, Bill, K5GCW

I was not aware of the way that the earth was connected in the USA, but it sounds much like the system used in the UK nowadays (termed PME - protective multiple earthing) where the internal house earth wiring is connected to the neutral where the supply enters the house. An external neutral fault can result in the earth rising to the live potential (230V in the UK) but provided all metalwork that you can touch in the house is bonded together, for example taps, radiators etc, then there isn't a hazard because no potential can exist between these conductive surfaces, even if collectively they are at the live voltage

However, there is a hazard if you bring an earth rod into the house. The RSGB Handbook gives warnings about this and which have recently been repeated in the RSGB "Rad Com" magazine That is why I tune up against mains earth, not an external earth rod, even though the chances of TVI and BCI are greater. If I was going to use an external earth rod, then I would devise some kind of RF transformer coupling after the ATU (I stress after the ATU, not before) and use shrouded connectors that have no exposed metal parts when unmated, perhaps similar to those used on DMM test cables these days.

In a typical ham station, parts of an antenna may have a DC connection to the internal house earth (via the ATU), for example one leg of a dipole, and so may rise to live potential in the event of a neutral fault. I wonder what the situation would be with a beam and a tower and whether the tower could become live.....

Richard G3OTK

I believe a floating neutral or a neutral above ground could result in death if you were handling something like a metal toaster, etc. If you become the ground thru some metal grounded object, I would think that's the end of the line??
Am I thinking correct?
73, be careful, Dave W0DLR

I acquired a TS-820S from a long time friend. The rig sat for 10+ years in his closet and worked perfect when he put it there. Now the rig will turn on but the digital display is dead and I can not receive anything when I hook up an antenna. I can hear static over the speaker but the rig will not hear anything. I read here that this radio has some oxidation issues because of its age. I am fully prepared to tear this radio down to get it working. My question is: where do I start looking for problems? Do I just tear the whole thing apart and clean it?

> I recently found a screamin' deal on my TS 830 S, got it with the
AT 230 for $75 both in the original boxes. It had been sitting on a
shelf for quite a number of years. I had to go in and wiggle all the
connectors inside, but everything seems to be working like new now
(knock wood). Both units look like they had never been out of the
box. The WARC bands had not even been opened up. Thanx to this group
I found the right wire (not 2 as the manual says) and rather than
cutting (again per manual) I was able to get the contact out of the
connector and tape it off. This leaves the possibility of putting it
back into the condition in which it originally left the factory. So
far I have been nothing but happy with this radio. Have worked all
the bands except 160, have to put up another wire for that one
(soon!).

Mike,
Is the meter light on and just not the display? If this is so look on the back and check the little black switch marked SW Switch and do not turn the radio it on until the switch is in the ON position.

I've had one of my 830's for 30 years now and only found this out after cleaning my second one the last time I cleaned it a couple of weeks ago.

It may sound dumb, but check it. I'd rather it sound dumb, and hope it's just that simple. go.

mikefr24 <mikefr24@...> wrote:
I acquired a TS-820S from a long time friend. The rig sat for 10+
years in his closet and worked perfect when he put it there. Now the
rig will turn on but the digital display is dead and I can not receive
anything when I hook up an antenna. I can hear static over the
speaker but the rig will not hear anything. I read here that this
radio has some oxidation issues because of its age. I am fully
prepared to tear this radio down to get it working. My question is:
where do I start looking for problems? Do I just tear the whole thing
apart and clean it?

How low will we go? Check out Yahoo! Messenger□s low PC-to-Phone call rates.

The WWV circuit is separate from the normal RX circuit. It is diode
switched where the antenna comes into the RF unit and has it's own
pre-amp and mixer circuit. Usually the voltage to switch the diodes is
missing.

Do you have a service manual?

FWIW, I wandered into a RadioShack store yesterday and found the Deoxit 'pen' style dispensers on clearance sale for just under $2.00. That's a good discount from the $10 normal price, so it may be worth a look if you have a shop in your area.

These can be used to clean up the switches and contacts in your vintage Kenwood hybrids (I'm trying to get back on topic :)

They are for different IF frequencies. The 8.8 (YK88C) IF is first in the RX chain and is normally the first filter installed. Most people are happy with only one. For maximum rejection the 455 filter is added to sharpen the skirts up more.

The earlier in the chain you narrow the bandwidth (8.8 IF) the less the later stages have to deal with.

Ruben,
Happy to hear you finally have a working TS-830S. Did you ever get the original one sorted out ?
I've been missing in action here for a couple of days. Had a Hard drive crash on Sunday. Lost about 100 Gigs of Data and programs and my last backup was in December 2005.....OOOPPSS !!
At least I had all my Family Movies and Digital Pictures backed up current ! Oh yea, and My ACLOG file hi hi...

8930. TS-820

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-22 21:22:13 UTC
From: Gordon
Topic: 2059 Message: 8930

I am selling my TS-820 that has the optional Digital Display installed.
My question is this:
Should I sell the Display separate from the radio?
I was thinking it might sell quicker that way as there are always guys
looking for the Optional Display (that works Pefect by the way) and
there always seem to be guys looking for an original TS-820 without
the display.. Thoughts ??

Things to check.
1. there is a switch on the back labeled SG. It is for turning the screen voltage off when neturalizing. It must be on.
2. this is more likely, there must be a dummy plug in the VFO socket. It you have none, use a piece of a standard size paper clip and jumper pins 8 and 9 together on the plug. These would be the farthest pins anti clock wise or would be first 2 pins to the left of the space.
3. be sure that your VFO swithc is straight up in the VFO position.
5. If this still gives you nothing, remove the cover and locate the regulator IC for the display. It is on a shiney heat sink near the display box. Check the 3 pins with a volt meter. One outside one will read 12v the other outside one will read 5v the center will read 0 volts. If you get no voltage here, you need to troubleshoot the 12 V power supply.

Let us know what you come up with and we will help you from there.

The purpose of this switch that I described to you is to leave it in the on position during normal operation. However, during a neutralization process of the final tubes, this awitch is moved to the off position. The process of adjusting the tubes is done at a setting of 28.5mhz, the swich is is set to off and there is a small variable capacitor adjusted on the inside bottom. Then after this is done the switch is set back.

Inyour case the switch may be set in the wrong position. If it is, then the result is what you saw.

So look it over tonite when you get home and see if that's the case. If it is what I think it is; turn that switch where it belongs hook up an antenna and enjoy the experience of your new found love.

Topic: 8919 Message: 8933

Bob,

Both of the are filters that passbands of 500 hertz. In other words the total band of froquecies that will pass thru is 500 hertz wide. They are both the same in that sense.

Now for the difference. the two are for different IF's (meaning Intermediate frequency). The one is for 8.8 mhz. Hence the term YK-88C (500Hz); meaning this filter is used in the dual conversion reciever in the 8.8 mhz IF section for giving a total of 500 Hz Passband. Reducing from 2.4khz. This may make the Variable BandwidthTuning control not very effective.

Now the YK-455C is a similar process. It does it's job down at the next level of the IF. Here it operates as a filter with a total bandpass of 500 hertz at 455 kilohertz. It is a very sharp CW filter but again the Variable Bandwidth Tuning control is not very effective.

Now, If you use both of these filters in the dual conversion process, the Bandwidth is still 500 hertz,however they can work together to bring you in performance a radio with excellent sensitivity, very sharp passband, and a maximum flexibility in the VBT. You can adjust your passband from as narrow as 150 hz to as wide as 500 hz. In a radio like the TS-830 for example it's considered the overall best combination of filters.

As many of us will atest out here, unless you know what your doing, do not change your fliters. These filter processes is one of the reasons these Kenwood radios do so well at giving such a good recieving performance.

You can take a desired signal with excessive interference frfom an adjacent signal turn the IF shift and adjust the notch an IF shift and eliminate an unwanted signal 2 khz away. I can also use the IF and VBT in combination. I adjust the VBT for best bandwidth and the IF shift for making the signal the most intelligible. Sometimes adjusting the notch and tone help too.

Thats what they are and thats what they are used for.
N3DOK <n3dok@...> wrote:
Hi,
Could someone explain the difference between a YG-455C 500Hz CW filter and a YK-88C 500Hz CW filter? Is there an advantage of one over the other?

Thank You,

They also show up on E-Bay occasionally. Down on 40 meters there is a swap net too.

FWIW, I wandered into a RadioShack store yesterday and found the Deoxit
'pen' style dispensers on clearance sale for just under $2.00. That's a
good discount from the $10 normal price, so it may be worth a look if you
have a shop in your area.

These can be used to clean up the switches and contacts in your vintage
Kenwood hybrids (I'm trying to get back on topic :)

Sorry to hear about your hard drive crash Gordon. Yes I finally have a working one.
Right now it's all apart faceplate and all. Giving it a good cleaning. Man the chassis on this
one is like new, just dusty. It has a silver logo instead of a gold one like my other TS830S.
Looked inside only 1 filter. Even the nylon drive gears are white not yellow on this new one.
No cracks either. TX a little low so I'll change the driver and finals. Have a bunch of brand
new spares here. Got a decent deal I believe. Only thing I didn't get the mic cable for the MC50.
Oh and I need the 4 small round feet that screw on the side of the case. Otherwise all is good.

PS: Pink roll cages on Dragsters can be painted...hihi

Subject: Re: [TS-520_820_530_830] Line Voltage Fluctuations

Richard:
With single phase in the US, the pole transformer is commonly fed with 7800 volts main to ground or 2400 volts. The secondary is a 240 V center tapped winding. The center tap is grounded and is the neutral. The 120 volt source is connected to the neutral and one end of the 240 volt winding giving 120 volts. Except with very olde systems, both legs are brought into the building and there is an attempt to somewhat balance the various 120 volt loads between the legs. If the neutral opens up or becomes resistive, the side that has the lower resistance will have the lower voltage and the side with the lower load will have the higher voltage. This works like a resistive voltage divider circuit where the resistors are not always equal. In practice, usually the refrigerator or a window air conditioner will come on and the side with the refrigerator or air conditioner will go lower in voltage, say 90 volts and the other side will go up to 150 volts, the sum being 240 volts. Not only can the high voltage cause problems but motors on the low voltage side will run hot and burn out.

One common problem outside is that sometimes power company employees will use copper crimps on aluminum or vice versa and over time these will corrode causing a resistive or open neutral. The neutral can also sometimes have a bad connection in the meter base or where it connects in the breaker panel.

If a person knows enough to not electrocute themselves, voltage measurements where the entrance cable enters the breaker panel between the 240 volt legs and from the neutral to each leg can tell the story.

How is the power set up in England?

Subject: RE: [TS-520_820_530_830] Line Voltage Fluctuations

I was not aware of the way that the earth was connected in the USA, but it sounds much like the system used in the UK nowadays (termed PME - protective multiple earthing) where the internal house earth wiring is connected to the neutral where the supply enters the house. An external neutral fault can result in the earth rising to the live potential (230V in the UK) but provided all metalwork that you can touch in the house is bonded together, for example taps, radiators etc, then there isn't a hazard because no potential can exist between these conductive surfaces, even if collectively they are at the live voltage

However, there is a hazard if you bring an earth rod into the house. The RSGB Handbook gives warnings about this and which have recently been repeated in the RSGB "Rad Com" magazine That is why I tune up against mains earth, not an external earth rod, even though

the chances of TVI and BCI are greater. If I was going to use an external earth rod, then I would devise some kind of RF transformer coupling after the ATU (I stress after the ATU, not before) and use shrouded connectors that have no exposed metal parts when unmated, perhaps similar to those used on DMM test cables these days.

In a typical ham station, parts of an antenna may have a DC connection to the internal house earth (via the ATU), for example one leg of a dipole, and so may rise to live potential in the event of a neutral fault. I wonder what the situation would be with a beam and a tower and whether the tower could become live.....

I believe a floating neutral or a neutral above ground could result in death if you were handling something like a metal toaster, etc. If you become the ground thru some metal grounded object, I would think that's the end of the line??
Am I thinking correct?

Subject: Re: [TS-520_820_530_830] Line Voltage Fluctuations

You need to measure the voltage on each side of the neutral and between the mains. this can be done at the box or at an electric stove connector. It should read 117 to 122 volts between the neutral and either high side of the 240 v stove outlet and 237 to 240 volts between the mains. What I bet you will experience is that when the voltage between the neutral and one of the mains goes up, the other goes down, but the voltage between the two mains stays about the same.

If this is the case, you have a neutral that is floating. This can damage many of your appliances. In some cases it can also cause a shock hazard. Your landlord should have it fixed immediately. In some cases it can also cause a shock hazard. I would not mention your ham rig when you talk to him as this is a problem for all of your appliances.

A way around this for your rig would be to set it up for 237 volt operation. Since we have more than 220 here some taps on your power transformer in the rig will need to be changed. If you choose this option, let us know and we can tell you how to do this.

However, If what I described above is correct, it needs to be fixed. I would not operate the rig until this is fixed. Plan to loose your TV, computer, VCR, and refrigerator shortly.

If you know what you are doing, you can try tightening up the neutral connections in the breaker panel. Particularly the one where the neutral comes in from outside. Be careful, you can get hurt. It may also be in the meter base or out on the drop. I see your in 6 land where salt corrosion is a serious problem on the lines outside.

Subject: [TS-520_820_530_830] Line Voltage Fluctuations

Hi gang,

Does anyone have any experience with abnormal
fluctuations in the AC main voltage?

Here's the basics. I live in an apartment built in
1962. Currently, on average, we blow a light bulb
every two to three days, including GE, Sylvania, &c.
By this I meanwhile lit, not when switched on.

Landlord brought in an electrician, who said line
voltage is bouncing from 100-140VAC. No problems with
any household electronics, & I run my 2M, scanner, &

SW rcvr off of a gel cell W/ a trickle charger.

I plan to set up my TS520, but wanted to go through
the mains rather than pull that much amperage from the
12V system. Anything unusual I should be looking for,
or doing differently other than toroids, groundstraps,
&c. I'm concerned that a high V spike could fry this
thing, which will be my primary HF rig.

Thanks,

DW White KE6WYB

Dealing with broken slugs.

The best way to deal with broken slugs is to avoid breaking them in the first place. Never use a metal screwdriver or a metal Allen wrench to adjust a coil. It will almost surely break. Use the proper plastic, fiberglass or nylon tool. Even if you have to wait to get the proper tool, it is a lot better than dealing with a broken slug.

If it ain't broke, don't fix it ! It is very very seldom that a coil or transformer that has not been tampered with after it was set at the factory will benefit from adjustment.

OK, so you got the rig from e-bay with broken slugs and it is not your fault. Here some notes that may help.

When trying to repair coils with broken slugs, patience and care is of the utmost importance. Remember that even if it takes considerable time to repair a jammed coil, it is insignificant compared to the time involved in trying to locate a replacement.

Some coils are actually transformers, but the same things apply regarding jammed or broken slugs.

Often when slugs are cracked, the slot on the top is split and a corner of the top of the slug wedges the slug tight. Sometimes this chip can be removed with a small precision screwdriver and this will free up the slug. The slug then can sometimes be worked out from the top by carefully pushing on the corner of what is left of the slot with a very small precision metal screwdriver.

The coils can be carefully removed and the slug sometimes can be backed out from the bottom. If the slug cannot be removed from the top then carefully work from the bottom and then sometimes the chip can be released from the top by slightly moving the slug from the bottom. On the end where the slot is good, avoid using a metal tool as that is probably how they got cracked in the first place. As a last resort, try the metal tool very very carefully to get a firm grip but do not apply too much pressure or you will be in bigger trouble fast.

I have also found that sometimes heating the slug from the top or bottom with a small soldering iron helps it break loose.

If the slug has one good end, smooth out any rough spots on the bad end and reuse the slug with the good slot up and of course use the proper plastic tool.

If nothing else works, after all else has failed, you can often CAREFULLY chip the slug out piece by piece using a small precision screwdriver and a small hammering device. I have even used a small drill bit and bored out the center of the slug. Start with a small bit and then use a bigger one until you can chip out the remaining slug. I do not use an electric drill for this. It will catch and destroy the coil entirely. I usually wrap masking tape on the shaft of the drill bit as a handle and use it as a hand tool. You will

begin to feel like a dentist at this point. OUCH!

If the threads in the coil form or slugs are stripped so the slug will not stay in place, shim a very small piece of a rubber band next to the slug but be sure it is small enough that it does not make the slug too tight.

If you encounter a coil with some brown goop in the top, that is bees wax. It can be scraped out and melted with a small soldering iron. The coil slug can be turned while the wax is still warm. I usually do not reseal these coils as they don't move. The exception is VCO coils that were already factory sealed.

If the was must be replaced, you can often find excess wax adjacent to the coil or a good inexpensive source of bees wax is a commode seal available for less that 2 dollars at hardware or building supply stores.

Sometimes, these coils are sealed by a paint like substance. It can be melted or burned out using a small soldering iron.

Replacement slugs:

CB radios from the same era as your rig are a good source of slugs as well as other consumer products from that era. The thread pitch and sometimes the diameter of the slugs varies. The CBs made by Cybernet such as Hy-Gains and Midlands, any CB that used a PLL 02A as a PLL chip is a possible candidate for Kenwood slugs. Most Uniden made units have slugs that are not the right thread pitch. Some Sears and J.C. Penny's radios also might have usable slugs. If you have a CB repair guy in the area that has been around for years, and his shop looks like a junk yard, he's the man!

The permeability of these slugs can vary but I have not very often had any problems changing slugs and disregarding this. There is usually enough range in these coils to compensate for this. Most of the slugs you will get will probably be found in the first IF of these rigs and they will be the correct permeability anyway. Although some from the PLL coil and transmit driver coils will work too. If the slug fits, try it.

One last hint! I remove the center shaft from the small diameter K-40 mobile wirewound CB antennas, and cut it into sections 3 inches long. Then I insert a section into a electric drill and turn it against the side of a turning bench grinder. I sharpen it to a point much like a pencil point only more pointed. Then I remove the tool from the drill and fashion the blade with the grinder to a small screwdriver point that will fit the slotted coils.

I am sure that there is other stock somewhere that is available. What you want is a blade that is hard enough to turn the coil slug but soft enough that it will break before the slug does.

The SG (Screen Grid) switch is used in neutralizing a new set of
finals. It does not affect the RX in any manner. It only affects TX in
that the radio will go into TX but not put out any power.

The normal operating position is "ON". Off is the position for
neutralizing the finals.

Maybe this will clear up some misconceptions about this switch.

Subject: Re: [TS-520_820_530_830] Kenwood Filters

Several days ago someone was looking for the info on the DH wiring for
TS-830 for wide and narrow filter switching. Well, in gathering up stuff
for a hamfest in MA this coming weekend, I found a kit package that
contained the original International Radio #94 and #96 filters (these are
2.1KHz filters one for each IF), daughter boards, components, and some
shielded cable that International Radio sold way back in the 80's and
early 90's. All instructions, including the DH info, is in the box. I
remember buying this years ago, never installed it, and thought I sold it
at Dayton years ago. I'm taking the package to the hamfest to find it a
new home. If the DH info is still needed, let me know quickly and I'll
make a copy of the info. After Friday, it's going to be history.

Pete, wa2cwa

8946. TS830S vs TS850S..Opinions

Okay so here is the deal,

I am contemplating trading my TS850S for a mint TS830, SP230 and AT230. Having a hard time deciding whether to do the deal or not. The 830 was one of my first HF rigs and for nostalgic reasons I would like to acquire a complete station. Aside from the obvious advantages and disadvantages of the two, advice is wanted.

And I would be looking for an SM-220 or VFO-230 to round out the station.

Thanks,

Max

Hi Walt,

Many thanks for your description of what happens when you have a "neutral fault" in the US. I was aware that there were two voltage standards in the US, but I didn't understand the basis for them.

In the UK, the area distribution is 3-phase 11kV (I believe) with local transformers that give 230V between each phase and the star-point of this transformer. The star-point is connected to earth at the transformer, I assume with a substantial earth rod. Houses are distributed over the three phases to maintain a reasonably balanced load (only one phase per house for safety). The two wires entering the house are defined as "live" and "neutral", the neutral being connected back to the star-point of the local transformer. The "Neutral" is usually only a volt or two above earth (due to the voltage drop in the neutral wire) whilst the "Live" is 230V above earth and so very hazardous. The mains frequency is 50Hz.

These days, house wiring has the house safety earth terminal connected to the neutral where it enters the house. All water pipes, central heating pipes etc are bonded together and connected to the house earth terminal. As explained in my earlier e-mail, because all exposed appliance metalwork and water pipes in the house are electrically bonded together, then a neutral fault outside of the house won't be hazardous to the occupants even though the house earth wiring will rise to near 230V.

A ham who has an earth rod for his antenna brought in to his shack is now at risk because a fault in the neutral line between the transformer and house will put 230V between any exposed conductors such as water pipes, radiators or metal parts equipment and his earth rod. The choice for the ham is now between an electrical fire or electrocution. Not a choice I want to make! This is why the RSGB Handbook warns against the use of earth rods for antennas and why I just tune my long wire "against" the mains earth wiring. Not perfect, but I get plenty of contacts and no one has complained about TVI/BCI (as yet).

As I mentioned in my earlier posting to the group, the fault discussed above would result in at least part of many antenna systems rising to 230V relative the outside terrain. This could include towers carrying beams. A good insurance policy with substantial public liability cover would seem to be in order....

Unlike the US system that you describe, I don't think that a Neutral conductor fault in the UK can over-volt the equipment.

Finally, a letter in the latest RSGB "Rad Com" magazine warns about using some equipment intended for the US 220V supply in the UK and recommends setting it to 115V and using an autotransformer to drop the mains voltage. Now you have explained some of the problems, I will go back and read the letter again to better understand it.

Richard G3OTK

Subject: Re: [TS-520_820_530_830] Line Voltage Fluctuations

Richard:
With single phase in the US, the pole transformer is commonly fed with 7800 volts main to ground or 2400 volts. The secondary is a 240 V center tapped winding. The center tap is grounded and is the neutral. The 120 volt source is connected to the neutral and one end of the 240 volt winding giving 120 volts. Except with very olde systems, both legs are brought into the building and there is an attempt to somewhat balance the various 120 volt loads between the legs. If the neutral opens up or becomes resistive, the side that has the lower resistance will have the lower voltage and the side with the lower load will have the higher voltage. This works like a resistive voltage divider circuit where the resistors are not always equal. In practice, usually the refrigerator or a window air conditioner will come on and the side with the refrigerator or air conditioner will go lower in voltage, say 90 volts and the other side will go up to 150 volts, the sum being 240 volts. Not onl! y can the high voltage cause problems but motors on the low voltage side will run hot and burn out.

One common problem outside is that sometimes power company employees will use copper crimps on aluminum or vice versa and over time these will corrode causing a resistive or open neutral. The neutral can also sometimes have a bad connection in the meter base or where it connects in the breaker panel.

If a person knows enough to not electrocute themselves, voltage measurements where the entrance cable enters the breaker panel between the 240 volt legs and from the neutral to each leg can tell the story.

How is the power set up in England?

Subject: RE: [TS-520_820_530_830] Line Voltage Fluctuations

I was not aware of the way that the earth was connected in the USA, but it sounds much like the system used in the UK nowadays (termed PME - protective multiple earthing) where the internal house earth wiring is connected to the neutral where the supply enters the house. An external neutral fault can result in the earth rising to the live potential (230V in the UK) but provided all metalwork that you can touch in the house is bonded together, for example taps, radiators etc, then there isn't a hazard because no potential can exist between these conductive surfaces, even if collectively they are at the live voltage

However, there is a hazard if you bring an earth rod into the house. The RSGB Handbook gives warnings about this and which have recently been repeated in the RSGB "Rad Com"

magazine That is why I tune up against mains earth, not an external earth rod, even though the chances of TVI and BCI are greater. If I was going to use an external earth rod, then I would devise some kind of RF transformer coupling after the ATU (I stress after the ATU, not before) and use shrouded connectors that have no exposed metal parts when unmated, perhaps similar to those used on DMM test cables these days.

In a typical ham station, parts of an antenna may have a DC connection to the internal house earth (via the ATU), for example one leg of a dipole, and so may rise to live potential in the event of a neutral fault. I wonder what the situation would be with a beam and a tower and whether the tower could become live.....

Gordon I suggest selling it with the unit. A digital display is helpful to some people. It may bring higher value to the radio. If the buyer doesn't want the display then take it out. Some of us can't see so well anymore. A digital display may help that person. There's always the analog dial for the aficianado of that sort of thing. I can read that but sometimes my sight isn't so good anymore. There will always be those out here who will read a dial.

Gordon <n6wk@...> wrote: I am selling my TS-820 that has the optional Digital Display installed.
My question is this:
Should I sell the Display separate from the radio?
I was thinking it might sell quicker that way as there are always guys
looking for the Optional Display (that works Pefect by the way) and
there always seem to be guys looking for an original TS-820 without
the display.. Thoughts ??

Richard:
You stated that you avoid using an earthing rod for antenna grounding. What if you connect the earthing rod to the neutral in the breaker box ? My tower is grounded with 3 earthing rods and a buried radial system. I had problems with lightning going to or from the neutral to the tower ground. A heavy wire from the tower to the power earthing rod solved that.

Now here is some crazy stuff. I live in an area where there are two power companies serving different parts of the county. One requires that the earthing rod be connected at the meter base. The other requires that it be hooked to the breaker panel inside the house. Neither allow both points to be hooked to even the same earthing rod.

Thank you for your explanation. I am interested in how other countries power systems work. What you use sounds like what we call a 3 phase "closed delta".

On your final note, I have run into problems here in the USA with Dual voltage rigs like the Kenwoods that are set for 120 and 220. Our 220 system usually is closer to 240. Sometimes this causes the 12BY7 to run away and the filaments are overvoltaged. There is a simple transformer tap change in the Kenwoods and Yaesus that corrects this problem. It is still tapped correctly for 120 if one needs to go back for some reason such as generator operation.

Hi Walt,

Many thanks for your description of what happens when you have a "neutral fault" in the US. I was aware that there were two voltage standards in the US, but I didn't understand the basis for them.

In the UK, the area distribution is 3-phase 11kV (I believe) with local transformers that give 230V between each phase and the star-point of this transformer. The star-point is connected to earth at the transformer, I assume with a substantial earth rod. Houses are distributed over the three phases to maintain a reasonably balanced load (only one phase per house for safety). The two wires entering the house are defined as "live" and "neutral", the neutral being connected back to the star-point of the local transformer. The "Neutral" is usually only a volt or two above earth (due to

the voltage drop in the neutral wire) whilst the "Live" is 230V above earth and so very hazardous. The mains frequency is 50Hz.

These days, house wiring has the house safety earth terminal connected to the neutral where it enters the house. All water pipes, central heating pipes etc are bonded together and connected to the house earth terminal. As explained in my earlier e-mail, because all exposed appliance metalwork and water pipes in the house are electrically bonded together, then a neutral fault outside of the house won't be hazardous to the occupants even though the house earth wiring will rise to near 230V.

A ham who has an earth rod for his antenna brought in to his shack is now at risk because a fault in the neutral line between the transformer and house will put 230V between any exposed conductors such as water pipes, radiators or metal parts equipment and his earth rod. The choice for the ham is now between an electrical fire or electrocution. Not a choice I want to make! This is why the RSGB Handbook warns against the use of earth rods for antennas and why I just tune my long wire "against" the mains earth wiring. Not perfect, but I get plenty of contacts and no one has complained about TVI/BCI (as yet).

As I mentioned in my earlier posting to the group, the fault discussed above would result in at least part of many antenna systems rising to 230V relative the outside terrain. This could include towers carrying beams. A good insurance policy with substantial public liability cover would seem to be in order....

Unlike the US system that you describe, I don't think that a Neutral conductor fault in the UK can over-volt the equipment.

Finally, a letter in the latest RSGB "Rad Com" magazine warns about using some equipment intended for the US 220V supply in the UK and recommends setting it to 115V and using an autotransformer to drop the mains voltage. Now you have explained some of the problems, I will go back and read the letter again to better understand it.

Exactly what I am planning on with the 830 I have coming. I picked up
a Kenwood 3 Khz SSB filter to drop into it. You might want to study
the schematics and/or service manual to accustom yourself with the TX
path in the 530. I'm sure these tube final rigs will sound sweet with
the proper setup. I am currently using a Behringer mic with a W2IHY 8
band EQ on my 850 which will soon be tranplanted to the 830.

Hello Max. Interesting! I didn't know kenwood made a 3KHZ
Filter...whats the model number for it? . Re my original post I
meant the carrier insertion point...not just insertion...although AM
would be interesting! Let me know how you get on...Incidently a
teardrop 575M6 sounds great on a TS-830! All the best

Dave,
Check out this File.
It has pictures to show you how to remove the VFO from an 820 and
clean the wiper without disassembling the VFO.

Searching on www.radioshack.com shows #64-4336, see:
http://www.radioshack.com/search/index.jsp?kwCatId=&kw=deoxit&origkw=deoxit

There's also a way to check what stores have it in your area, but I'm not
sure how accurate the info is.

8967. TS-820S Blowing Fuses

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-24 01:37:43 UTC
From: mikefr24
Topic: 8967 Message: 8967

The rig now works perfect in recieve mode. When I turn on the heater, the fuse blows about 10-15 seconds later. I have blown two 4 amp fuses and am now concerned. I am not even transmitting, the send key is in recieve mode and the MODE switch is USB. I do not even have a mic or CW key installed. (VOX is off too). I have read the manual several times about tuning the finals and can't even get to that part.

From: w5rkl
Topic: 8951 Message: 8968

Dave,

You do not have to remove the VFO to clean the VFO variable capacitor tension spring. Remove the 2 phillips screws on the right side of the VFO. Turn the VFO either to the end of its travel on the bottom or top of the band. Spray DeOxit on the spring contact where it meets with the variable capacitor shaft and turn the VFO through its travel. Perform this twice, wait about 2 minutes for the DeOxit to evaporate then test it.

Just a bit of advice. Removing the VFO in an 820 is not as easy as it may look. The key is to not lose any of the screws especially the very small ones on the VFO zero beat dial. Do not remove the VFO with it setting at the middle of the band. Make sure you have turned it to the low end of the band, i.e. 7.000.00. Do not attempt to reinstall the VFO unless you have done this otherwise the analogue dial will be off and the numbers showing up in the small square window will not be correct.

Once completed, the dial, if properly installed, should turn like oil on glass. Any drag or scraping by any of the 2 dials should be corrected. Make sure the numbers show up properly as you pass the 100 KHz mark on any band. If they don't, you've not reassembled it properly. To ensure the numbers show up correctly and centered properly in the small window, the one and only one number 5 must be on the upper right and absolutely no where else. The manual discribes this and if you get it wrong, the numbers will either be off center or do not show up properly at the 100 KHz alignment vertical mark.

If you use lubrication, use it sparingly and only use it on the small brass gears and not on the VFO shaft. Pay close attention that you do not pinch any wiring between the VFO mount and the chassis when reassembling. Also, the wires to the digital display are easily pulled from the digital display board so caution must be exercised there. Yes, the digital board must be removed before the VFO is even unscrewed from the front panel and below the chassis. The power and VFO output cables should be removed and placed out of the way to prevent damage to them.

Good luck.

73's,

Mike
W5RKL

Exactly what I am planning on with the 830 I have coming. I picked up
a Kenwood 3 Khz SSB filter to drop into it. You might want to study
the schematics and/or service manual to accustom yourself with the TX
path in the 530. I'm sure these tube final rigs will sound sweet with
the proper setup. I am currently using a Behringer mic with a W2IHY 8
band EQ on my 850 which will soon be tranplanted to the 830.

Dave,
Although some may think removing the VFO on an 820 is Difficult, I found it to be quite easy. I will agree to be sure that you do NOT lose the small screws. I used a small plastic container to keep them in. I removed the upper and lower covers, removed the VFO, cleaned the wiper, reinstalled the vfo, calibrated the dials and did all this with in about 45 minutes. My advice, just take your time and do not force anything. It really is very easy to do. Once you are done, you will have become very intimate with your 820 and you will realize how easy it actually was to clean the VFO wiper.

8971. TS-830S No Plate Current Dip

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-24 03:30:15 UTC
From: Bill Scurlock
Topic: 8971 Message: 8971

Hello to "The Group".

I finally got the receiver working in my recently purchased TS-830S, and now I am starting on the transmitter.

After tuning the Drive Coils, there are very strong ALC indications on all bands. On 20M, it loads to 10W output in Tune at 90Ma with the Plate Tuning Indicator in the 28MHz range, and when switched to CW for loading up, the Plate current goes very high and the output power drops. On 17M, it loads up normally in the CW mode to about 90W output at 200Ma with the Plate Tuning Indicator again in the 28MHz range. On all other bands, there are strong ALC indications, but no Plate current dip and no power output. Attempting to dip the Plate current in the CW mode, results in about 300Ma of Plate current, and no resonance dip can be found on any band except 17M.

A prior owner really had all the Driver Coils waaaaay out of tune. So I'm wondering what else he could have messed with that could be causing this problem.

The bandswitch has been removed from the RF Board and remounted, but Kenwood service worked on this radio years ago and may have done this - or maybe not. In switching from band-to-band in receive, nothing "weird" seems to be happening with the bandswitch. The digital display seems very stable in switching from band-to-band. It appears that the original insulated shaft coupling going into the RF cage is in good shape, and the switching action in the final tank circuitry looks positive. Is it possible that when the bandswitch was removed/replaced that the shaft coupling was re-tightened with the final tank circuit switches in the wrong rotation position? Does anyone know an easy way to check this?

All the power supply voltages are good, and everything else seems to be ok, except no 6146 plate tank circuit resonance on most bands (and the resonance on 17M is at the wrong position of the Plate Tuning capacitor).

Any ideas or comments on how to analyze this situation will be appreciated. Thanks for listening.

73, Bill, K5GCW

I agree, I'd be tempted to trade my Mint 830 and VFO-240 with cash for another TS-850S.
I love my 830, But my 850 is really a nice rig (I have all the filters installed in it also)
I think my 850 might just have the best receiver of all my rigs.
Don't get me wrong, I really like the 830 also, but the 850... well, what can I say!

Topic: 8971 Message: 8973

Hi Bill,
I just checked my 830 here. When the Plate capacitor plates are fully closed) level on both edges) my plate control is pointed at about the 9 oclock position and when the plates are fully open, The control is at about the 3 oclock position.
That is relative as just loosing the set screws allows you to make the dial read what ever you want.
Now, The band switch shaft has two flats that should line up with the four offset set screws. If it is in the wrong position, the screws will not be pushing against the flats on the shaft.
If you need, I can take some close up pictures of the bandswitch and each of the wafers at a set position . The service manual shows where each wafer should be when in the 1.5 band position.

73,
Gordon

I'm suspecting you might have bad finals in that rig.

Bill, K5GCW,
Is it possible that when the bandswitch was
removed/replaced that the shaft coupling was re-tightened with the
final tank circuit switches in the wrong rotation position? Does
anyone know an easy way to check this?

Go to the website of K4EAA, Ken Kemski and he explains how to take the bandswitch wafers apart for cleaning and put them back. You will find his site very informative. I ordered the brass coupling from him to replace my bandswitch coupling. Mine is in good alighment, however, you have to turn the knob to one "edge" to make the proper connection. Replacing that bushing should stop that.

Hope this helps.

Walt,

My warnings about the dangers of a neutral line fault are based on what happens with the UK wiring standard and may or may not be applicable in countries that use different distribution techniques. You have to think it through for each situation.

However, to answer your question about connecting it to the main earthing terminal in the house. I think the answer to this is no because it would be no good as an RF earth and in the event of a neutral fault the current in the earth wire is not limited in any way. The current depends on the equipment and appliances connected - after all the neutral fault may be close to the transformer in which case it is not just the equipment in my house, but those of my neighbours as well.

Many years ago I was renting a house that had old wiring and may have relied on earthing to the incoming metal water pipe - that's how things were done many years ago over here. Unfortunately, the incoming water pipe had probably been changed to a plastic pipe and was no longer a connection to the "real earth". For some reason, there was a live-to-earth short and all of the water pipes in house rose up to 230V. I discovered this whilst taking a bath, when I tried turning on the hot tap with my foot! The only reason I am am here to write this e-mail is that the current through me was due to the capacitance of the water and myself to earth, perhaps a few hunderd pF, so the current was small. Needless to say, I moved elsewhere shortly afterwards!

Subject: Re: [TS-520_820_530_830] Somewhat OT - cheap Deoxit at Radio Shack

Richard:
You stated that you avoid using an earthing rod for antenna grounding. What if you connect the earthing rod to the neutral in the breaker box ? My tower is grounded with 3 earthing rods and a buried radial system. I had problems with lightning going to or from the neutral to the tower ground. A heavy wire from the tower to the power earthing rod solved that.

Now here is some crazy stuff. I live in an area where there are two power companies serving different parts of the county. One requires that the earthing rod be connected at the meter base. The other requires that it be hooked to the breaker panel inside the house. Neither allow both points to be hooked to even the same earthing rod.

Thank you for your explanation. I am interested in how other countries power systems work. What you use sounds like what we call a 3 phase "closed

delta".

On your final note, I have run into problems here in the USA with Dual voltage rigs like the Kenwoods that are set for 120 and 220. Our 220 system usually is closer to 240. Sometimes this causes the 12BY7 to run away and the filaments are overvoltaged. There is a simple transformer tap change in the Kenwoods and Yaesus that corrects this problem. It is still tapped correctly for 120 if one needs to go back for some reason such as generator operation.

Subject: RE: [TS-520_820_530_830] Line Voltage Fluctuations

Hi Walt,

Many thanks for your description of what happens when you have a "neutral fault" in the US. I was aware that there were two voltage standards in the US, but I didn't understand the basis for them.

In the UK, the area distribution is 3-phase 11kV (I believe) with local transformers that give 230V between each phase and the star-point of this transformer. The star-point is connected to earth at the transformer, I assume with a substantial earth rod. Houses are distributed over the three phases to maintain a reasonably balanced load (only one phase per house for safety). The two wires entering the house are defined as "live" and "neutral", the neutral being connected back to the star-point of the local transformer. The "Neutral" is usually only a volt or two above earth (due to the voltage drop in the neutral wire) whilst the "Live" is 230V above earth and so very hazardous. The mains frequency is 50Hz.

These days, house wiring has the house safety earth terminal connected to the neutral where it enters the house. All water pipes, central heating pipes etc are bonded together and connected to the house earth terminal. As explained in my earlier e-mail, because all exposed appliance metalwork and water pipes in the house are electrically bonded together, then a neutral fault outside of the house won't be hazardous to the occupants even though the house earth wiring will rise to near 230V.

A ham who has an earth rod for his antenna brought in to his shack is now at risk because a fault in the neutral line between the transformer and house will put 230V between any exposed conductors such as water pipes, radiators or metal parts equipment and his earth rod. The choice for the ham is now between an electrical fire or electrocution. Not a choice I want to make! This is why the RSGB Handbook warns against the use of earth rods for antennas and why I just tune my long wire "against" the mains earth wiring. Not perfect, but I get plenty of contacts and no one has complained about TVI/BCI (as yet).

As I mentioned in my earlier posting to the group, the fault discussed above would result in at least part of many antenna systems rising to 230V relative the outside terrain. This could include towers carrying beams. A good insurance policy with substantial public liability cover would seem to be in order....

Unlike the US system that you describe, I don't think that a Neutral conductor fault in the UK can over-volt the equipment.

Finally, a letter in the latest RSGB "Rad Com" magazine warns about using some equipment intended for the US 220V supply in the UK and recommends setting it to 115V and using an autotransformer to drop the mains voltage. Now you have explained some of the problems, I will go back and read the letter again to better understand it.

Don't understand it either. The 850 has a better receiver, and transmit audio wise, it will run rings around the 830.
Hey, I got an 830. Anybody wanna trade for an 850 or 870??

If you're looking for "quality audio" (whatever that means on SSB), you most likely would have to by-pass the front-end audio circuitry (or modify it) and go directly in the balanced modulator stage. 830 audio circuitry was never tailored for "quality Hi Hi FB audio". You can add as many boxes as you like between the mike and the mike jack.

Well I'll admit the 850 is a nice radio, I've owned four of them, but
I wouldn't say it would run circles around the 830. I think the 830
has better TX audio and the receive is very quiet. I've owned a few of
them too. Obviously the 850 has a lot more going for it, but for basic
SSB operation the 830 is hard to beat. It comes with a matching SP230
and AT230 and "NEW" MC50 mic. I'd like to acquire a complete line as
it was one of my first HF rigs. So I may have a mint MC50 up for sale
soon.

Max:
I have a Kenwood T-820 that I purchased an INRAD model 88 2.8 kHz filter for. I was wanting to improve my transmit audio a bit by extending the low end to 200 Hz instead of 400 Hz without losing any high end. To my very pleasant surprise, it made the receiver awesome! Even though it is a bit wider, the skirts are sharper so I actually found that in many cases, adjacent frequency interference, particularly from strong signals was improved. The audio quality was very much improved as well as the ease of tuning in SSB signals. the top of the curve is smoother "less bumps" resulting in much better sound. I feel that it has more than doubled the personal value of my TS-820 to me. The TS-820 also has a small problem that many people do not notice. The AGC overshoots a bit causing the IF to overload for a very short instant on voice peaks. The model 88 has an extra pole and reduces the IF gain ever so slightly. This fixed the overshoot problem. I love the receive audio that I am getting from this rig now.

The model 88 will also work in a TS-530.

A TS 830 is dual conversion so in addition to the model 88, you will need a model 89, which is also 2.8 kHz for the 455 kHz IF.

BTW, I have never been pleased with narrower filters on SSB such as 2.1 or 1.8 kHz. . To me, they sound like wet cotton is in my ears.

I couldn't agree more Walt. I've always preferred the full range SSB sound. I am a little concerned because the filter I have for the 8.83 IF is 3 khz wide and as you mentioned the widest I can get for the 455 IF is 2.8, although still better than 2.4 Khz. I put the 3 khz filter in the 850 temporarily and did notice a slight difference with it over the 2.7 filter. I guess for full effect I will have to change both, although the INRAD is pricey at $155.

Mike:

STOP!, HALT!,QUIT! UNPLUG THE RIG. Go to the Files section of this site and read the article, "Save your transformer". You have a fairly simple problem, but you are about to have a major expensive one that can render your rig as a parts radio.

Build the light bulb tester, that is a 100 watt light bulb in series with the live side of the AC line. It will glow bright when there is a short and dim if there is not one. It will act as a ballast and keep the transformer from overloading. Every time you blow a fuse you are stressing the transformer greatly and soon it will short. Transformers for these rigs are very expensive and very hard to find.

Now, once you get the light bulb tester connected, you need to locate the short. It is most likely a shorted tube. It can also be caused by no negative grid bias. I am betting on the tubes. Again, with the light bulb in line, turn the SG switch on the back off and turn the filaments on. If all is proper the light bulb will glow bright and dim as the tubes warm up. If it glows bright starts to dim and then brightens again, likely the tubes are shorted. If you have a tube short, you need to check the 10 ohm resistors on the final unit board that go to the cathode circuit. they usually burn out and need to be replaced when this happens.

Make the light bulb tester and get back with us.We will help you fix the rig.

Be sure that the bandswitch coupling that connects the bandswitch shaft to the wafers in the final unit is proper. It may not be turning the wafers in the final unit properly. the previous owner may have had this problem and tried to fix it by turning the coils that you just fixed.

Walt,

My warnings about the dangers of a neutral line fault are based on what happens with the UK wiring standard and may or may not be applicable in countries that use different distribution techniques. You have to think it through for each situation.

However, to answer your question about connecting it to the main earthing terminal in the house. I think the answer to this is no because it would be no good as an RF earth and in the event of a neutral fault the current in the earth wire is not limited in any way. The current depends on the equipment and appliances connected - after all the neutral fault may be close to the transformer in which case it is not just the equipment in my house, but those of my neighbours as well.

Many years ago I was renting a house that had old wiring and may have relied on earthing to the incoming metal water pipe - that's how things were done many years ago over here. Unfortunately, the incoming water pipe had probably been changed to a plastic pipe and was no longer a connection to the "real earth". For some reason, there was a live-to-earth short and all of the water pipes in house rose up to 230V. I discovered this whilst taking a bath, when I tried turning on the hot tap with my foot! The only reason I am am here to write this e-mail is that the current through me was due to the capacitance of the water and myself to earth, perhaps a few hunderd pF, so the current was small. Needless to say, I moved elsewhere shortly afterwards!

I looked at my 830 manual. Page 24, says in the table on the lower right. with now filters installed total passband is 2.4 khz.Now I might be wrong, but I sense that the 830 was designed for only 2.4 kilohertz or less. What do you need so much passband for anyway might I ask?

Hi All,

The stock Murata CFJ455K5 or CFJ455K12 filter in your 830S' 455khz I.F. is already 2.9khz wide. Before I bought a 2.8khz 455khz Inrad filter to drop in my 830S, just swap out the 8.83mhz filter with your 3khz filter and see if you like the audio response. Read Rich Measures "Circuit Improvements and Maintenance Procedures for the TS-830S" at http://www.somis.org/830.html where he talks about swapping out both the RX and TX audio roll off capacitors. Also, write this down where you will remember it ....'NEVER USE CERAMIC CAPS IN AUDIO CIRCUITS!' They will skew the audio response. Use electrolytic, mylar, tantalum or plastic ones. Also, as the Inrad 8.83 filters are much larger than the stock Kenwood YK filters and you have to use RG-174 coax to connect the Inrad filter to your I.F. board, make sure you use .01 caps on the + leads to the filter or you will have dead short.....You will wonder why your Kenwood went deaf.

I couldn't agree more Walt. I've always preferred the full range SSB sound. I am a little concerned because the filter I have for the 8.83 IF is 3 khz wide and as you mentioned the widest I can get for the 455 IF is 2.8, although still better than 2.4 Khz. I put the 3 khz filter in the 850 temporarily and did notice a slight difference with it over the 2.7 filter. I guess for full effect I will have to change both, although the INRAD is pricey at $155.

Now you know why they were cheap. They'd been sitting on the shelf for so long.

I did the same thing with a can of CRC Lectra Clean a month ago. It normally sells for upwards of $40. I bought it for $6.49. I got it home and started to use it and found I used half the can and the propellant was gone. I had to go back to Home Depot for another can. I got the job done for still less than I would have payed for the full priced can, But here are two cans of solvent half-full. guess I should find another container to keep all the solvent in for another project that may not happen till after the solvent is no longer usable.

The TX bandwidth is limited by what filters are in the radio. It is all a matter of opinion. Personally I find 2.4 to be a little narrow, although some people find it quite acceptable. Widening it up to 2.8 or 3.0 khz makes for very comfortable listening and the difference is noticeable. Again it is all a matter of personal preference. When you swap the filters it also affects your TX bandwidth. The wider filters will give your signal a fuller sound with nice lows. Years ago I swapped the standard 2.4 filter out of a TS570 and put a 3 Khz filter in and the difference was amazing. Hopefully I'll get the same results with the 830. I know they sound great as is, it is my fall project.

Hi John,

The answer to your question is audio fidelity. Plus, if you use a spectrum analyzer to see what your total passband is on your receiver that has both first and second I.F. filters, you will be surprised to see that it is narrower than either filter value. I.E., If you have a pair of 2.4khz filters your total passband will be approx. 2.2khz. Your 830S manual states total passband is 2.4 khz and if you look in the schematic you will see it has a 2.7 in the 8.83 and a 2.9 in the 455 I.F respectively...

Hello All,

The Kenwood YK filters are ...YK88S (2.4khz) YK88S1 (2.7khz) and YK88S2 (3.0khz.) Do not confuse the filters with a hyphen before the last number 1...As in YK88S-1. The -1 filters are mounted on a plug in board for post 440S model Kenwoods. The YK-88S2 and CFJ455K12 (Yes, the same little Murata ceramic one as in your 830S) are the stock filters in the TS-870S

SNIP

>
> The bandswitch has been removed from the RF Board and remounted, but Kenwood service worked on this radio years ago and may have done this - or maybe not. In switching from band-to-band in receive, nothing "weird" seems to be happening with the bandswitch. The digital display seems very stable in switching from band-to-band. It appears that the original insulated shaft coupling going into the RF cage is in good shape, and the switching action in the final tank circuitry looks positive. Is it possible that when the bandswitch was removed/replaced that the shaft coupling was re-tightened with the final tank circuit switches in the wrong rotation position? Does anyone know an easy way to check this?
>
> All the power supply voltages are good, and everything else seems to be ok, except no 6146 plate tank circuit resonance on most bands (and the resonance on 17M is at the wrong position of the Plate Tuning capacitor).

To align the bandswitch sections;

Put the radio on 10Mhz. The flats on the shaft should be vertical. Check the shaft in the final compartment. There should be a flat to the outside (right side of radio viewed from front) and one to the bottom. This is the correct alignment.

OK Max, Thank You.

I never heard of this before. But with what's left of my hearing I probably couldn't tell the difference anyway, I must admit. I got used to the older radios over the years and the TS-830 was as much as I needed for front end-recieve.

Transmit was just I needed to hear what was said (intelligibility). To me I got good reports back in QSO's and the signal climbed over the qRM and N and B enough to do the job.

Good luck with the project Max. Enjoy.

SNIP

>
> The bandswitch has been removed from the RF Board and remounted, but Kenwood service worked on this radio years ago and may have done this - or maybe not. In switching from band-to-band in receive, nothing "weird" seems to be happening with the bandswitch. The digital display seems very stable in switching from band-to-band. It appears that the original insulated shaft coupling going into the RF cage is in good shape, and the switching action in the final tank circuitry looks positive. Is it possible that when the bandswitch was removed/replaced that the shaft coupling was re-tightened with the final tank circuit switches in the wrong rotation position? Does anyone know an easy way to check this?
>
> All the power supply voltages are good, and everything else seems to be ok, except no 6146 plate tank circuit resonance on most bands (and the resonance on 17M is at the wrong position of the Plate Tuning capacitor).

To align the bandswitch sections;

Put the radio on 10Mhz. The flats on the shaft should be vertical. Check the shaft in the final compartment. There should be a flat to the outside (right side of radio viewed from front) and one to the bottom. This is the correct alignment.

9003. Shelf Life of Caig DeoxIT

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-24 16:38:01 UTC
From: N3DOK
Topic: 9003 Message: 9003

Hi, I check the Caig web site. Here is what they list for the shelf life of DeoxIT. I put the date of purchase on chemicals that I purchase. Also the price. It explains why the tube of glue was hard as a rock. I bought it years ago. Gorilla Glue has a 6 months life, after you open it.

Bob N3DOK

* Warranty ** Storage - Life

DeoxIT 100% Liquid 1 year 2-3 years

DeoxIT 5% Liquid 1 year 2-3 years

DeoxIT 5% Sprays 1 year 2-3 years

* Warranty: CAIG will warranty its products for a period of 1 year from invoice date. Storage conditions must be

adhered to.

** Storage Life: If storage directions are adhered to, products will last considerably longer. Values are

conservative. If coloration or separation of products occur, we recommend discarding and purchasing new

product.

Storage Instructions: Store in a cool, dry place. Keep container tightly closed. Do not subject to excessive heat

or cold.

Avoid Contaminating Solutions: When using bulk liquids we recommend transferring small amounts into a

smaller container for use. This will avoid contamination of the larger container from dirty cleaning swabs, cloths,

brushes, etc.

http://store.caig.com/

From: Rick May
Topic: 8954 Message: 9004

Hi John,

Yes, to a point.... There is a point of diminishing return on filter bandwidths. You would put 2.8khz filters in your radio to have more high and lows in both transmit and receive audio for a fuller, more natural sound. You will lose some selectivity though. Also, people seem to forget that they transmit through these filters. Some people are using 3.3khz filters trying for that ultimate 'hi-fi' sound and invoking the wrath of other people on the bands because while their audio may be better (very subjective), their transmit signals are VERY wide. They may also find it more expensive when they get popped by the FCC for having a signal wider than 3khz. Conversely, it sends shivers up my spine, like fingernails on a chalkboard, to listen to people with 1.8khz filters in their radios. They sound like 12 year olds. Before I swapped filters though, I would work with the audio rolloff capacitors in the radio. Your radio may not pass any audio frequency over 2.5khz regardless of filter bandwidth. Using 2.8khz filters offer a good balance between fidelity and selectivity. But, if you like to work contests or just like to hunt around during contest time for new countries, stick with the 2.4khz. filters.

Hi Max,

Yes, the YK88S2 will drop right in the 830S ....Look and see which Murata 455 filter you have. The older CFJ455K5 is ~3.2khz. while the newer CFJ455K12 is 2.9khz. If you have the older K5 filter, I wouldn't run much processing or you will be quite wide. You will probably also have to change out the audio coupling and frequency roll off capacitors in your radio to pass the higher frequencies.

9008. OT TS-570S Is It A (G) version?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-24 15:28:34 UTC
From: Ken Gunton
Topic: 8914 Message: 9008

I know this group is for hybrids, but I'm sure you'll allow me one off-topic question:

I just received a TS-570S that I bought on E-Bay. How can I tell if it is the (G) upgraded version the seller says it is?

Any help would be greatly appreciated.

Still not giving up my 830S. The 570 will be mainly used for six meters and portable opns.

Thanks,
Ken W8ASA

9009. TS-830S No Plate Dip

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-24 18:27:02 UTC
From: Bill Scurlock
Topic: 9009 Message: 9009

Thanks to all of you for the assistance. It was the rotational position of the bandswitch inside the PA cage. It was 180 degrees off.

A special thanks to Clif who gave me the quick and easy way to determine the proper relative position of the PA switch in reference to 10 MHz.

This is just another confirmation that this is one of the best "reflectors" on the web.

The Plate dips as it should, and over 90 watts output - success. Now I can look for all the other items that need attention in this radio.

Thanks, 73, Bill, K5GCW

No duh moment Rick, it is in fact the 830 I am referring to. So when the radio gets here I will see what 455 filter it has in it. The 2.9 or 3.2 is fine either way, I have no desire to go wider than 3 khz anyway. I will try and couple the audio in after the mic amps as the W2IHY EQ has it's own amplifier. I use the mic in jack strictly for digital work although I will probably fill the 2 spare holes on the back with patch in and out lines.

Max

The "G" model among other things, has a user programmable DSP menu.
You can, or could download a program off the net that would allow you
to set your own bandwidth and upload it to the radio. I also think
there is a power-on button sequence you can do to tell you if it is in
fact a "G" model.

Max

9012. Re: [TS-520_820_530_830] Re: 2.8KHZ Inrad filter for TS-530S

Yahoo group: TS-520_820_530_830 (2006)

From: n9wb
Topic: 8954 Message: 9012

Most of these rigs roll off at 400 Hz. As a matter of fact they are 6 dB down at 400 Hz.

The audio gets much warmer and pleasant if we can move this 6 dB point down to say, 200 Hz. Now, we can do this by moving the carrier point a bit closer to the filter bandpass but this cuts a few hundred Hz from the top end and makes it sound limited and reduces articulation. This lost 200 Hz makes more difference than you would think. EQ boost at the top end will not fix this because the filter will no longer pass the lost 200 Hz. There is another issue of the top of the filter bandpass having ripple in some of these stock filters. This is why you can change identical stock filters and have a slightly different sound..

By adding the 2.8 kHz model 88 Inrad filter, at least to my TS-820, I gained 200 Hz at the low end and gained an additional 200 Hz at the top end over the original set up. Yes more bandwidth, but it is important how you position it.

With the Model 88 filter, interference to adjacent frequencies actually reduces because the skirt ratio is increased so while the flat bandwidth is a bit wider, the stuff that is above the bandpass that causes the interference is further suppressed than the original filter.

If you are a person that does not hate cell phone audio so long as you can understand it, and is satisfied listening to music through a small cone, this is not for you.

But if you prefer the distortion from a blues guitar that is generated by an overdriven vintage tube amp over that which was generated with a fuzz box, If you prefer the sound of a harp (harmonica) played through a vintage Astatic JT-30 over one using a Shure 58 , and like to hear the air switching through a sax or a cornet, You gotta have one.

For those who are not as radical as those above, it still makes the sound more "open".

Now you olde guys that have hearing problems, if you can still hear up to 4 kHz it might help you.

BTW I am 57

There is a limit on how close you can place the carrier point to the filter bandpass. The filter bandpass on filter rigs is part of the carrier suppression. If you get too close you start loosing carrier suppression. That is why I said down to 200 Hz instead of lower. The digital synthesized rigs do not have this problem as much. I can explain that more later.

ESSB is the extreme sport version of what we are doing. But with what we are doing, we do not have the bandwidth issues to deal with.

Some people like to jump out of perfectly good airplanes. I like to fly perfectly good airplanes and get beck to earth by landing them.

In all fairness to the pilots, I don't have a pilots license. I have flown quite a bit in friends planes wit them beside me. I love it.

I have two dreams in my life. One is to own a plane. The other is to be a Ham Radio Operator.

I have realized one of my dreams.
I will never realize the other.
But one out of two isn't bad.

> STOP!, HALT!,QUIT! UNPLUG THE RIG. Go to the Files section of this site and read the article, "Save your transformer". You have a fairly simple problem, but you are about to have a major expensive one that can render your rig as a parts radio.
>
> Build the light bulb tester, that is a 100 watt light bulb in series with the live side of the AC line. It will glow bright when there is a short and dim if there is not one. It will act as a ballast and keep the transformer from overloading. Every time you blow a fuse you are stressing the transformer greatly and soon it will short. Transformers for these rigs are very expensive and very hard to find.
>
> Now, once you get the light bulb tester connected, you need to locate the short. It is most likely a shorted tube. It can also be caused by no negative grid bias. I am betting on the tubes. Again, with the light bulb in line, turn the SG switch on the back off and turn the filaments on. If all is proper the light bulb will glow bright and dim as the tubes warm up. If it glows bright starts to dim and then brightens again, likely the tubes are shorted. If you have a tube short, you need to check the 10 ohm resistors on the final unit board that go to the cathode circuit. they usually burn out and need to be replaced when this happens.

9016. hand mic question

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-24 13:49:11 UTC
From: scott
Topic: 9016 Message: 9016

Hi to the group,
I have a TS-520S and am looking for suggestions on hand mics that would be good to use with this rig? What type of mic element, impedence (high I would think), maybe a make and model # to search for, etc. Thanks for reading and any suggestions. cheers, kg6brg.
scott.

Great explanation Walt. I have no desire to widen my signal up so much
you can copy it on either sideband or transmit a carrier along with
the audio as I have so often heard on 14.178. It is quite possible to
have fantastic full body sounding audio in only 3 khz of spectrum,
that's my goal. And after that, I will add some audio DSP! And my wife
wonders why she never sees me anymore!

9018. Re: [TS-520_820_530_830] OT TS-570S Is It A (G) version?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-24 20:05:40 UTC
From: Rod Goff
Topic: 8914 Message: 9018

Hi Ken

This may help you. It did me

Rod in WV

What's the difference between the (G) and non-(G)

Versions of the Kenwood TS-570D and TS-570S radios?

Here are the features that the (G) series upgrade made to the 570D and S:

1. TX sound quality monitor with 9-step monitor volume for absolute control over voice

quality

2. NR1 (SSB) is operator controllable in 9-step increment, or automatically tracks input

signal strength

3. New CW DSP Filters (80 Hz, 150 Hz and 500 Hz) give you a total of 11 userselectable

filters

4. NR1 and NR2 settings can now re-configure automatically when changing mode

groups (SSB/AM/FM to CW/FSK)

5. Manual weight feature (with built-in electronic keyer) for adjusting the relative length
of

dots and dashes in 16 steps between 1:2.5 and 1:4.0

6. Equalize receive signals, and use different settings for both TX and RX

7. "One-touch" DSP filter wide mode allows 'resurfacing' to check the band conditions

when operating in narrow mode

8. Dual selectable Beat Cancel (BC) works against intermittent beat interference (except

in CW mode)

9. CW auto tune mode links only with the RIT frequency without changing the transmit

frequency

OK, so how do I tell if my radio is a (g) model?

The easiest way to tell if you have a (g) model is to press BC (near the upper-right

corner of the front panel) once -- it should beep. Then press and hold it. It should make two beeps (indicating it just went into the improvement listed at No. 8 above). If it does not give two beeps but instead one, lower-pitched beep (indicating an erroneous keypress), then you don't have a (g) model.

Subject: [TS-520_820_530_830] OT TS-570S Is It A (G) version?

I know this group is for hybrids, but I'm
sure you'll allow me one off-topic question:

I just received a TS-570S that I bought on
E-Bay. How can I tell if it is the (G)
upgraded version the seller says it is?

Any help would be greatly appreciated.

Still not giving up my 830S. The 570 will
be mainly used for six meters and portable
opns.

Thanks,
Ken W8ASA

Thanks to all who answered. I lucked onto
a really nice guy at Kenwood in SoCal, who
told me to hit the menu button and turn
the multi-knob to see if it goes past menu
number 46. If it does, it's a G.

Apparently, the G added some cool things,
as you have below, but he told me that being
able to do some filter skirt shaping is
the best thing they added, in his opinion.

So, now I have to get my money back from the
guy who ripped me off.... grrrrr. I hope it
won't be a problem. He has a lot of positive
feedback on E-Bay.

9022. MC50 Mic problem

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-24 21:59:39 UTC
From: Jack
Topic: 9022 Message: 9022

Hi Group. Great things are going on here. Here's my latest problem.
I have an MC50 mic that isn't working so I decided to remove the element
and see if there was anything wrong. There is. After removing the
cage, I carefully pulled the element out and found that it is not
wired to the mic base at all. I have a black and a white wire coming
from the mic base and only have a lose white wire on the mic element.
Can anyone describe to me or send me a pic of the mic element and how
it should be wired to the mic?

Thanks in advance ---- Jack

Sorry Reuben, but for some reason or other the station pics I can't reach. In fact any of the archives I can't seem to get access to. It just comes up a yellow screen sys yahoo in red letters and has a white square box in the middle.

I went looking for save the transformer this morning, and all I got was that. Your pics the same way. But I definitely like your 360 page. The letters really stand off well in the background on the radio gear. yours got a little more work done than mine. you go by name and I go by call.

Hey you on the air yet? I keep remebering to ask you but for some reason or other I don't seem to recall an answer. That's my memory for you.

Just about on the air. The CW input jack was crunched by Fed-Ex and have to repair it. Otherwise
the radio is doing well. I plugged my key in and nothing happened, then I noticed it was tilted a bit.
The input plug didn't want to go in I tapped it lightly and it went, but seems like the contacts are stuck.
As soon as I plug in the key it goes into TX mode. So have to repair it.
I'll send you some pics direct.... 73 Ruben

Sorry Reuben, but for some reason or other the station pics I can't reach. In fact any of the archives I can't seem to get access to. It just comes up a yellow screen sys yahoo in red letters and has a white square box in the middle.

I went looking for save the transformer this morning, and all I got was that. Your pics the same way. But I definitely like your 360 page. The letters really stand off well in the background on the radio gear. yours got a little more work done than mine. you go by name and I go by call.

Hey you on the air yet? I keep remebering to ask you but for some reason or other I don't seem to recall an answer. That's my memory for you.

I like what you did with your 360 page. A definite change over what it was the other time I was down there. Now about those pics. That's where I wanna see next. hope you get running soon.

From: mikefr24
Topic: 9031 Message: 9031

Hey N9WB,

I built the 100W light bulb tester and followed your instructions. With the SG switch off the light bulb was pretty dim, then I turned on the heater and the light was bright and slowly faded to dim (like it was).

When I turn SG on, the Light is dim. When I turn on the heater, The light is a bit brighter for a second and then goes dim. Over about 10 seconds the light slowly grows brighter and brighter until its fairly bright and I can hear a slight humming in the rig. i immediatly turned off the rig and here I am now.

I tested the 10 Ohm resistors on the Final board (I found two big resistors 10 Ohm from the markings) and they both read ok.

I pulled out my two final tubes and examined them. One looks ok and it has a black burn mark on one side of it on the inside of the glass casing. Normal??? The other one looks bad, There is a big hole inside burned in the metal plate covering and the glass casing in that same area looks like a melted sink hole. It was hot enough to melt the outer glass covering. I take it this is my problem tube?

The tube number reads GE Electronics 6146B/8298A. This rig was bought used in 1990 by my friend and I bought it last week from him. My friend told me he never changed the tubes or had any trouble with the radio. He did not know what the original owner did.

I am clueless about tubes so I read the 6146 tube faq in your files area. Pretty interesting. I find it strange that I have the 6146B tubes and not the 6146A or 6146W tubes. Do I need to buy a set of 6146B tubes off ebay?

Thanks,
Mike KC8QNO

9032. Re: 2.8KHZ Inrad filter for TS-530S -- TS-830 VBT Question

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-25 01:24:23 UTC
From: Larry Shorthill
Topic: 8954 Message: 9032

Walt and others,

Rick Measures has a calibration method for moving the VBT oscillator frequency from its nominal fixed calibration point to a frequency +/- 150 Hz from that point to maximize the effective bandwidth through the 8.83MHz and 455KHz filters. It's easy to find on his website so I won't link to it here, but has anyone done this calibration? What do you think of it? What you are doing is moving the VBT oscillator off nominal frequency to center the filter skirts with respect to each other when VBT is centered. The reasoning is that the filters have a center Freq spec of a say +/-150 Hz and since they aren't matched for consistent shift anyway, this method just centers everything up.

I did it according to his instructions and opened up the effective bandwidth of my stock filters by about 150 Hz (calibration was initially off nominal by 56 Hz high and by the time I found the sweet spot the VBT osc had been tuned down about 85Hz below nominal). I would think that with the addition of the 8.83 MHz Inrad filter, this cal procedure would need to be done again. Anyway, I just wanted to know if anyone had performed his technique. I believe the same procedure can be done on the TS-930 and virtually any other dual conversion transceiver that implements Kenwood style VBT. By the way, I annotated the frequency that I set the VBT oscillator onto the copper strap on the transformer with a Sharpie, so you see it when looking into the uncovered rig. I noted that it was set according to Measure's technique and it's really visible if you are doing the VBT cal adjustment from the top. Never hurts to leave a documentation trail behind you.

Cheers
Larry, KC7ULI

>
> Most of these rigs roll off at 400 Hz. As a matter of fact they are 6 dB down at 400 Hz.
>
> The audio gets much warmer and pleasant if we can move this 6 dB point down to say, 200 Hz. Now, we can do this by moving the carrier point a bit closer to the filter bandpass but this cuts a few hundred Hz from the top end and makes it sound limited and reduces articulation. This lost 200 Hz makes more difference than you would think. EQ boost at the top end will not fix this because the filter will no longer pass the lost 200 Hz. There is another issue of the top of the filter bandpass having ripple in some of these stock

filters. This is why you can change identical stock filters and have a slightly different sound..
>
> By adding the 2.8 kHz model 88 Inrad filter, at least to my TS-820, I gained 200 Hz at the low end and gained an additional 200 Hz at the top end over the original set up. Yes more bandwidth, but it is important how you position it.
>
> With the Model 88 filter, interference to adjacent frequencies actually reduces because the skirt ratio is increased so while the flat bandwidth is a bit wider, the stuff that is above the bandpass that causes the interference is further suppressed than the original filter.
>
> If you are a person that does not hate cell phone audio so long as you can understand it, and is satisfied listening to music through a small cone, this is not for you.

> Now you olde guys that have hearing problems, if you can still hear up to 4 kHz it might help you.
>
> BTW I am 57
>
> There is a limit on how close you can place the carrier point to the filter bandpass. The filter bandpass on filter rigs is part of the carrier suppression. If you get too close you start loosing carrier suppression. That is why I said down to 200 Hz instead of lower. The digital synthesized rigs do not have this problem as much. I can explain that more later.

Get any hand mike that you like. Wire the plug for your Kenwood. Replace the element with a Heil HC-5. That will be about as good as it gets with a hand mike. Heil has a handimike that is a miniature MC-50 or 60 type mike. A HC-5 can be placed in it. Cobra made a simulated wood grain hand mike that was gorgeous and had a good cord. It sounded awful. An Hc-5 would fix it right up.

The 520 works best with a high Z mike. 10 K to 50 K. Too low for an uamplified D-104 desk mike.

This would be a good topic for our KenwoodMics group. We shure could use some traffic. (shameful hint)

It is a sister group to this one.

HI Scott,

I'm one of those weirdos, who prefers trhe ergonomics of hand mics, to desk mics. I did a little testing of one for the group, in my TS-820, a few months ago.

Your 520S will need a high impedance mic of around 50K ohms. If you don't know where to get one, you can get it from where I got mine: Ken's Electronics. Here's their URL:

http://www.kenselectronics.com/lists/mics.htm#Amateur

Go halfway down the page, to where it says: "Microphones for Amateur Radios." You will find a listing for a mic for the TS-520S, for about $29. Realize this, Ken is a recycler of sorts, so you may find that the mic case is used (mine is). But, I have no complaints with mine. I get decent audio reports with it.

73,
Ellen - AF9J

Hi Mike,

The 6146A really isn't used for radios like the Kenwood Hybrids. As for the 6146B tubes - yeah, you could use them. The only places you can get them are maybe on e-bay, Nebraska Surplus, or one of the group members. They are scarce (almost as scarce as the original 2001B tubes that these rigs came with), and very pricey. Most of us use the 6146W nowadays. It is still pretty available, and if you buy RF Parts' Phillips/JAN 6146Ws, they are essentially the same as the good old 6146B, and are probably more durable, since they are milspec tubes. I installed (and neutralized) a set in my TS-820 a few months back, and they work great. I get 100 to 115 watts of output power out of my 820 with these tubes (dpending upon the band I'm on).

One word of warning - DO NOT get the chinese 6146Ws. I (and a few other group members) made the mistake of trying out these tubes, to our sorrow. When I fired up the heaters. The Chinese 6146Ws (which I paid $58 for) flashed over, and took out resistors in my high voltage board, and finals board, giving me the opportunity to make repairs. Now I'm stuck with a set of tubes that I can't use.

Ok. I will keep a lookout for a new set of tubes. What is tube "neutralizing" and how do I do it?

I also notice that tubes can be bought as a matched set. IS this something I need to make sure I get?

Mike

Due to the age of the TS-820, I would replace the high voltage filter capacitors - that will cause fuse blowing problems somewhat intermittent at the outset of going bad.

Hey N9WB,

I built the 100W light bulb tester and followed your instructions. With the SG switch off the light bulb was pretty dim, then I turned on the heater and the light was bright and slowly faded to dim (like it was).

When I turn SG on, the Light is dim. When I turn on the heater, The light is a bit brighter for a second and then goes dim. Over about 10 seconds the light slowly grows brighter and brighter until its fairly bright and I can hear a slight humming in the rig. i immediatly turned off the rig and here I am now.

I tested the 10 Ohm resistors on the Final board (I found two big resistors 10 Ohm from the markings) and they both read ok.

I pulled out my two final tubes and examined them. One looks ok and it has a black burn mark on one side of it on the inside of the glass casing. Normal??? The other one looks bad, There is a big hole inside burned in the metal plate covering and the glass casing in that same area looks like a melted sink hole. It was hot enough to melt the outer glass covering. I take it this is my problem tube?

The tube number reads GE Electronics 6146B/8298A. This rig was bought used in 1990 by my friend and I bought it last week from him. My friend told me he never changed the tubes or had any trouble with the radio. He did not know what the original owner did.

I am clueless about tubes so I read the 6146 tube faq in your files area. Pretty interesting. I find it strange that I have the 6146B tubes and not the 6146A or 6146W tubes. Do I need to buy a set of 6146B tubes off ebay?

Thanks,
Mike KC8QNO

Topic: 9022 Message: 9040

Jack:
I have the MC-50 manual posted in the Files section of the KenwoodMics group.
You will note that the white wire connects to a solder pad on the side of the element. The black wire connects the same way to a solder pad on the opposite side.
If the solder pad is intact opposite where the white wire attaches to the element, that is where the black wire goes. The white wire from the mike would connect to the white wire to the element.

I suspect that the solder pad is gone and the very thin copper enameled wire going to the diaphragm is broken. If you can find it and attach to it some way you might be able to save the element. Otherwise, it will need to be replaced. Some of the tape recorder mikes of the 70's and 80's had this element in them. Some of the Diesel CB noise canceling hand mikes sold at truck stops had this element. Really, this element does not sound all that good. A Heil HC-5 is a very improved replacement.

Subject: [TS-520_820_530_830] MC50 Mic problem

Hi Group. Great things are going on here. Here's my latest problem.
I have an MC50 mic that isn't working so I decided to remove the element
and see if there was anything wrong. There is. After removing the
cage, I carefully pulled the element out and found that it is not
wired to the mic base at all. I have a black and a white wire coming
from the mic base and only have a lose white wire on the mic element.
Can anyone describe to me or send me a pic of the mic element and how
it should be wired to the mic?

Thanks in advance ---- Jack

Hi again Mike

Tube Neutralizing is done to balance out the load between the two final tubes. They run in parallel (basically Class A), but neutralizing helps the tubes to last longer. Also, in some cases, if your finals are not neutralized, you can have problems with spurious emissions, and in extreme cases, the finals could even go into parasitic oscillations.

I assume that your manual for the 820S is identical (or at the very least similar) to the manual for my TS-820 (the first year version fo the 820 series). The manual has the procedure for neutralizing the finals. Basically, what you are doing, is nulling out the noise from the finals. You're taking a signal sample (via a T-connector) off of the SO-239. If you don't have an RF probe and volt meter to do it as the manual calls for, you can take your null readings 2 other ways:

1. Use an RF probe, and an oscilliscope. Then adjust the varicap for the finals, for minimum readout on the scope.
2. If you have a very sensitive QRP wattmeter (and by sensitive, I mean that it will read decently down below 5mW of power), you can use it to adjust for the null. You hook it up in-line with your TS-820S, and a dummy load, and make your null readings (you may have to sweep the finals varicap back and forth through the null point, to get the center setting point for the cap). This is the method I used (I have an OHR QRP wattmeter that will read as low as 1mW). The procedure went well, and my rig is working fine with the new finals (well, actually I put them in about 4 months ago).

A word of caution: You have to leave the cover on, over the finals, and adjust them varicap through a hole in the cover. A plastic tuning/adjustment tool is too wimpy to do the job (the varicap is kind of stiff in its movement). You will have to use a regular, flat blade screwdriver. BUT, you will need to insulate the metal shaft (either with a piece of shrinkwrap, or a thick layer of electrical tape). Because, you will be working around 800V from the finals. As an additional safety precaution, you might want to do like a lot of old timers use to do in the past, when working on powered up tube equipment, keep one hand in your pocket, and use the other hand for fiddling in the radio. This helps to prevent the creation of an electrical circuit from on hand to the other (which would allow current to flow through your heart [which of course can be fatal]) .

Because the screwdriver has a metal shaft, you will be dealing with it having an affect on the varicap capacitance. So, you will need to double check your null readings, after you remove the screwdriver,

and then reinsert the screwdriver, and readjust the varicap, so that
the null occurs, with the screwdriver removed.

73 & I hope this gives you an idea of the procedure,
Ellen - AF9J

9045. Is it Possible to clean the mode switch contacts on my 830S ?

Yahoo group: TS-520_820_530_830 (2006)

Has anyone had success cleaning the contacts on the 830S mode switch ?

Since the contacts are hidden by the palstic shell they are not
exposed, but there is a small gap between wafer sections. Will simply
flooding the switch with spray work ?

Tnx

Tom,

I don't see why not. I use ProLabs PL-100. It is a spray lube with
dielectric properties. It cleans switches like you wouldn't believe
and lubes the mechanical part at the same time.

Thanks for the info and help. I have an oscilliscope so I will use
that method to perform the repair. There is a swap in my area this
Sunday and I am going tube hunting for the first time!!

Is it correct to assume that if I am balancing the load between the
two final tubes in the radio, then buying matched sets of tubes is
not really important?

Thanks,

Mike

Scott:

It will fit in almost anything. Go to this link, it can be purchased here.

http://www.heilsound.com/

BTW, this a really cool site to browse with nice graphics

Click on Amateur Radio. On the left, scroll down to CONNECTORS & MISC.

Click on HC-4 / HC-5 elements

Although these spec at 1000 ohms, they will work fine with your rig. It is advantageous to bridge a low impedance element with a higher impedance if it has enough output. this element was designed for the Kenwood 520 / 820 series.

You should also look at the HM-5 under microphones it has the HC-5 element in it.

Scott, if you or anybody else has any more comments or questions on this subject, please join and contact us on the KenwoodMics Yahoo group.

The unamplified D-104 will work but has a very middy sound when loaded at 50K. Sometimes this can be desirable. The amplified D-104 interfaces this load to 1 meg across the element and is a bit more full. I have a D-104 amplifier modification posted in the Files section of the KenwoodMics group that loads the element at 10 meg ohms and makes it more full yet.

"The 520 works best with a high Z mike. 10 K to 50 K. Too low for an
uamplified D-104 desk mike." <snip>

FWIW: I'm not sure of audio input differences between the 520 and 530,
but I use a classic D-104 with my 530 and get typical Kenwood "great
audio" reports on the air.

Has anyone had success cleaning the contacts on the 830S mode switch ?

Since the contacts are hidden by the palstic shell they are not
exposed, but there is a small gap between wafer sections. Will simply
flooding the switch with spray work ?

Tnx

Tom / W1PKX

Hi Mike,

Some of us run our rigs without matched sets, without any problems.
So yes, you don't necessarily have to use a matched set of finals.
In my personal opinion, a matched set is easier to neutralize than an
unmatched set, which is why I use them. If you buy from places like
RF Parts, they will sell you a matched set.

73,
Ellen - AF9J

Yeah, every time I try to look at something, the Norton thing gets in the way. With my concentration these days I forget alot too. That's been holding me back on CW and it irks me to no end. I go for a ride and I get lost. I need to get check'd for a.d.d. and a.d.h.d. boy that sounds like a degree in something, but I forget what.

Ruben Echevarria <ka2hhb_2000@...> wrote: Ok John, I was wondering what the problem could be. I went right in....

OK, Reuben. It did the same thing to me again. So I turned off the Norton Internet Security for 5 minutes and closed the web page, upon reopening I could see the pics for the first time. Now I think I know why I haven't been able to reach into the archives also. Thank You Reuben.

Sorry Reuben, but for some reason or other the station pics I can't reach. In fact any of the archives I can't seem to get access to. It just comes up a yellow screen sys yahoo in red letters and has a white square box in the middle.

I went looking for save the transformer this morning, and all I got was that. Your pics the same way. But I definitely like your 360 page. The letters really stand off well in the background on the radio gear. yours got a little more work done than mine. you go by name

and I go by call.

Hey you on the air yet? I keep remebering to ask you but for some reason or other I don't seem to recall an answer. That's my memory for you.

I had really good results with a Shure 527A hand mic. on a 520s. It is high impedance & natural sound &
needs no battery.
They are a little pricey but built like a tank & very comfortable fit to the hand. Don't get the B model as it is low impedance & won't work well with the 520S high impedance input.
I'm sure there are others that will work also but the shure is not a bad choice
73, George

Many thanks to all for the comments re 2.8Khz filter. Will report when I have decided the way forward.
My Ts530S sometimes takes up to 3 minutes to come to life! When I first switch on The meter and dial lights come on but nothing else except AF Audio can be heard but No RF or Freq display. I leave it and it suddenly springs to life then works perfectly. Any one had this before and any suggestions appreciated. What a great radio and a good group! All the best
Pete

9057. Neutralizing our tubes (S2001A - 6416B -6416W operating in Class AB1)

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-26 09:51:08 UTC
From: tetrodehead
Topic: 9057 Message: 9057

Hi Ellen and all,
My poor understanding of the neutralizing process is that it reduces coupling through plate - grid capacitance to a minimum, thereby reducing the probability of oscillation.

I can't see that neutralizing can balance the load between parallelled tubes.

I am no expert and may be barking up the wrong tree!
Would a tube expert please clarify.

Thanks
Dave F4EYK

First of all I'd like to thank everyone for all your help and suggestions. I went to a friends house who has several 820s's and we dug into this beast. We swapped out all boards with no improvement then we swapped out the relay and lo and behold it came to life. So we replaced all the original boards did an alignment and now it's working great. Hope to see you on the air.

Hi Dick,

I contacted Caig sometime back. I asked them which of their products would be good for cleaning older Amateur Radio equipment. DeOxit was suggested. Also as I read some of the older files of this group, There is suggestion of the use DeOxit.
With so many contact cleaners on the market, I would say it is like which motor oil is best for your car. Years ago A Tech told me not to use any contact cleaner that left a lubricant on the Bandswitch area.

Now I can see Emails telling what other brands of contact cleaner work better.

Hi Bob,
There are at least 10 DeOxit products many with overlapping capabilities. Have you tried this stuff, and if so, which is the best for general purpose wafer switch maintenance in the hybrid Kenwood series?

Wow what a way to find out it's a relay. Well at least you got the 820 up and going congradulations.

Jack <kf4yio@...> wrote:
First of all I'd like to thank everyone for all your help and suggestions. I went to a friends house who has several 820s's and we dug into this beast. We swapped out all boards with no improvement then we swapped out the relay and lo and behold it came to life. So we replaced all the original boards did an alignment and now it's working great. Hope to see you on the air.

Good Fix Jack,
Throwing parts at it until the problem is found is one sure way of
finding the problem.. hi hi.
Sometimes I wish I had the spare parts to do that on some of these rigs.
Glad you got it working.
73,
Gordon

Well, right now I do not have any problems (challenges as politicians say). I was thinking about preventive maintenance with a view toward removing any "crud" before it becomes so bad as to cause something nasty. At that time it may not be as easy to clean. Guess I will go with the vanilla DeOxit simply due to its popularity. As I said the descriptions for the 10 different varieties of DeOxit overlap and are redundant in some respects.

I was just sitting here looking at my TS-830S set up which is the TS-830S, VFO-230, SP-230 and the AT-230. I decided to work some PSK and was Loading up the TS-830S to the dummy load and then decided to check the SWR on the antenna with the AT-230. Well I could not check the SWR because I could not see the meter.

My question is has any one added a light to the AT-230 meter ? If so please let me know how you made the modification.

9066. TS830S No Drive on 30m

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-27 02:02:48 UTC
From: Ron Hauser
Topic: 7936 Message: 9066

Greetings Kenwood Gurus. About two months ago I was working along with Joe Sloss K7MKS, Bill Schurlock KG5CW, and Joan from Down Under VK5KYO. Bill helped get me set up with a VTVM, I eventually got an RF probe made, and finally I have done some testing.

The problem:

I have a TS830S that I got from the previous owner about a year ago. There is no drive at all on 30m, no matter the position of the drive control knob (also no RF out). All other bands produce drive (and I've had QSOs, seem to be working fine). It receives just fine, I've listened to WWV and various CW and digital QSOs on 30m. I have verified that the WARC bands have been enabled by snipping wire #1 on connector #6 according to the manual. I've tried lots of wiggling of the bandswitch, also poking carefully at the bandswitch contacts, also tested resistance on the bandswitch contacts which are outside the finals cage. No wiggling ever gives a twitch of drive, and all the contacts outside the finals cage show continuity. On receive the drive control does peak the signal.

Based on Joan's problem with a missing band, I tested C74 and L36 on the RF board. I believe that both these components are ok -- L36 showed right at the 4 ohms level Joan was looking for, and C74 is not shorted and doesn't look burned or anything.

I then took Joe's advice and attempted to measure the RF voltage on the grid of the driver tube. I believe this is a promising path, but I must first verify that I measured on the _correct_ pin. So. I have the radio sitting right side up on the bench with the covers off, the RF board is exposed and the driver tube is right there in the middle. I'm looking down at the tube/socket from above -- actually I am also looking at the board layout diagram in the service manual, which is the same orientation of course. I'm a little fuzzy on the "proper" numbering order of the pins. But anyway in this orientation the gap with no pins is at 9 oclock. There is a pin at 8 oclock, one at 7 oclock, one at five oclock. After staring at the diagrams and thinking about it for a while, I believe the pin at 7 oclock is the one that I want. So I put the rf probe on that pin and with the rig in tune, I switched to send and indeed I got RF.

Question #1. Am I on the right pin (or if not what am I measuring!?!)

Question #2. If I am on the right pin, I have an interesting result, because the RF voltage is not the same. At 14110 kHz I got 1.5 V. At 7110 kHz I got 1.4 V. But on 10110 kHz I got 5.2 V. Hm!!!

Subject: [TS-520_820_530_830] TS830S No Drive on 30m

Hi Joe, understood. I had come to a similar conclusion this afternoon after our previous emails; a VTVM would be very handy right now. I'm going to proceed as recommended, I will build an RF probe to use with my DMM. I will also keep an eye out on Ebay and the other sites for a VTVM which is what I really need. Using whichever of those I get hold of first I'll start tracing as you recommended.

To restate the problem for future reference: I have a TS830S that I got from the previous owner about 8 months ago. There is no drive at all on 30m. All other bands produce drive (and I've had QSOs, seem to be working fine). It receives just fine, I've listened to WWV and various CW and digital QSOs on 30m. I have verified that the WARC bands have been enabled by snipping wire #1 on connector #6 according to the manual. I've tried lots of wiggling of the bandswitch, also poking carefully at the bandswitch contacts, also tested resistance on the bandswitch contacts which are outside the finals cage. No wiggling ever gives a twitch of drive, and all the contacts outside the finals cage show continuity. On receive the drive control does peak the signal. Therefore my current thinking is to look for trouble somewhere besides the bandswitch, my best thought being to check C74 and L36 on the RF board as noted by Joan VK5KYO.

I've changed the subject to more accurately reflect this issue, so that it will be easier to find in the future. I will have some time to work on the radio again tomorrow, then I'm out of town for vacation and for work for a few weeks. I'm archiving all these conversations so that I'll be able to come back to them.

I appreciate your coaching.

To: Ron Hauser
Subject: Re: [TS-520_820_530_830] TS830S low power

Ron: There are several Heath RF probes on ebay that could be adapted to use

with your DMM. Handiest thing in the world when you need one.

The fact that your DRIVE control peaks a received signal tells me that the BS and associated circuits on 30m may be OK.

I was going to ask you to measure RF voltage at the grid of the driver tube.

Do this on 40 and 20 when you are in the TUNE position. Then check 30m.

If you have about the same RF voltage then the 30m circuits BEFORE the grid

are working correctly. If the 30m voltage is lower or non-existant then
your problem is before the grid of the driver tube.

Before I go too far you might refresh my memory as to the problem you are
having. I think I've deleted some of your earlier comments on what was
wrong and what does what.

I have a 820s and have just bought a at-230 which hasn't arived yet. I
will be looking at the same thing and will probably go with a white
LED as I have an abundance of 12V available.

Hi Dave,

Nope, you have it quite right. I realized that after I write my message. It's just that it seems to be easier to reduce this capacitance in a matched set. When you've reached the null point, you've eliminated the oscillation (or at least reduced the oscillation to an extremely low level, where it won't cause problems).

73,
Ellen - AF9J

Mike and others:

With push-pull amplifiers such as with tube type guitar amplifiers balance between the tubes is very important. Each tube produces one half cycle of the audio waveform and if one is different from the other, the waveform will be unbalanced causing distortion. Sometimes these tubes have individual bias adjustments, In other amplifier designs, there is a balance pot that tilts the bias a bit more to one tube or the other to exactly balance the tubes even if they are a matched pair. This is usually done by placing a tone that is a sine wave through the amplifier and the balance or bias is adjusted for minimum distortion as observed on the output with an oscilloscope.

Our rigs have tubes in parallel instead of push pull. Exact balance is not nearly so critical as with push-pull but it is helpful and the closer the tubes are balanced, the cleaner will be the signal that is produced.

If the tubes are not balanced, the 60 ma bias will actually be a compromise between these tubes. For example, one tube may draw 40 ma and the other 20 ma for the total of 60 ma instead of 30 ma each. This means that one or both of the tubes will not be biased to the optimum linearity point. There is considerable allowable tolerance in this before the problem will be noticeable.

Another problem that this will cause is that the stronger tube will be doing more work and running hotter causing faster degradation. Again, a slight imbalance is not critical but a great imbalance can be troublesome.

It is possible to use unmatched tubes but it is better to use tubes that are of the same manufacture, look exactly alike inside and check close to the same on a tube checker. Even better is a matched pair.

Tubes have some natural capacitance between the elements. Of particular concern is that capacitance between the plate and the grid. With 6146/S2001 types, this has little effect on lower frequencies such as 80 meters, but as frequencies increase to 20,15, and 10 meters, this can be troublesome resulting in reduced output and sometimes self oscillation or parasitic emissions.

To compensate for this, a capacitive network is intentionally placed between the plate and the grid circuit that provides feedback that is 180 degrees out of phase with the feedback caused by the inter-electrode capacitance. This equal and opposite value neutralizes or cancels the original inter-electrode capacitance.

With the TS-820 and other similar Kenwood hybrids, there is a switch on the back that changes the positive screen bias to a negative voltage. This shuts the finals current flow off and they will not amplify thus providing a convenient method of neutralization. Any remaining signal on the output is signal from the driver that is leaking through by way of the final tube's inter-electrode capacitance. If we adjust the neutralization capacitor with the SG switch off while observing the output on a scope or other sensitive device, we can nudge the neutralization adjustment until there is little of any signal leaking through.

There are other methods of doing this, but since Mike has a 30 MHz scope, this will be the easiest for him.

The inter-electrode capacitance of the tubes in parallel is the sum of the total for both tubes. The Control grids are in parallel, and the plates are in parallel. Balance is not a factor from a neutralization standpoint. You are not balancing the tubes by neutralizing, you are canceling out the sum inter-electrode capacitance of these tubes.

There is a specified frequency upon which neutralization should be performed. This is different between different models of rigs. The TS-820 (s) specifies a frequency of 21.300 MHz. To neutralize with a scope, tune up the rig near 21.300 into a dummy load. Turn the SG switch off and connect a coax T connector to the rig output or dummy load input so the rig is feeding the dummy load through the T connector. Using a scope probe, connect the scope to the open terminal of the T connector and the scope probe ground lead to the connector ground. Key the rig on CW with the Car. control fully up (Clockwise) and observe the RF carrier signal that will appear as a wide bar on the scope. Nudge the neutralization capacitor until the signal is at minimum. Keep increasing the vertical gain on the scope until you can see that you are indeed at minimum.

Unkey the rig and remove the scope probe before turning the SG switch back on.

The depth of the neutralization will often not be as deep on other bands as it will be on the specified neutralization frequency, in this case 21.300 MHz. This is normal with multi-band rigs.

The cover must be left on the final cage and it is best to use an insulated tool for adjusting the neutralization capacitor. However, I sometimes have experience problems that the capacitor is so stiff that the tool breaks before the capacitor will turn.

As an alternative, find a proper size screwdriver with a well insulated handle. Do not use wood because it can absorb moisture and become a conductor. Ouch!
Place two layers of shrink tubing or good quality electrical tape around the shaft down to the blade. This is to prevent the shaft from shorting out on the edge of the access hole. Nudge the capacitor a bit at a time one way or the other and remove it. Observe the scope to see if the signal has increased or decreased. Continue a nudge at a time in the direction that brings you to the minimum point, removing the tool each time you check the

scope. When you have found the minimum point, it is neutralized.

There is another way to neutralize by observing the characteristics of the dip on the IP meter and the output peak with the SG switch on.. Since Mike has a scope, I am describing the scope method at this time.

Hi Dave,

Nope, you have it quite right. I realized that after I write my message. It's just that it seems to be easier to reduce this capacitance in a matched set. When you've reached the null point, you've eliminated the oscillation (or at least reduced the oscillation to an extremely low level, where it won't cause problems).

73,
Ellen - AF9J

Good Morning To All,
I have decided to sell my TS-520S. It has been a great rig but I
just do not feel well enough these days to play radio.
With the radio comes the matching SP-520 speaker, a new Astatic
amplified hand mic, op manual, and factory box for the radio.
The radio works well and looks great and has no known issues.
I am asking $225.00 for everything. Would prefer pickup at my home
in Crystal River Florida or will ship in the cont US at your expense.
It will have to be shiped in two boxes.
If you are interested please email me off list at
dfeigley1@... Or you can call me at 727-417-6224 after 7 pm
EST.
Thanks and have a great day.
Charlie W4CDF

No problem at all. The 12V comes from a converted server power supply, about 40 amps available at my desk.

Pete, Wayfound2000,
I would first take a phillips screwdriver, and slightly loosen and then retighten every circuit board in the radio. You might just cure it right then and there. I just recently got a beautiful 530s, and all of them were loose.

Pete,

I have a TS-830S on the bench that exhibits the same behavior. I traced it to the 9V regulated circuit. When malfunctioning it puts out much less than 9V although the pre-regulated (input) voltage is normal. Suddenly, the regulator starts outputting 9V and the rig works normally. I have not yet isolated the responsible culprit(s). It originally appeared to be a mechanical problem such as a poor solder joint but so far I have been unable to find any. The regulator circuit uses several discrete transistors vs a three terminal device such as a 7809.

I want to see if I can find an easy way to isolate the output of the regulator from the rest of the circuit. The regulator may not be the problem. There may be a defective downstream component in the rig that is temporarily drawing too much current and then suddenly stops doing that.

If I can separate the regulator from the circuit I can use a metered (volt & mA) and current-regulated bench supply to see what is going on in the rest of the rig. At the same time I can put meters and an independent load on the isolated 9V supply to observe its behavior. This will isolate the problem to the rig or the 9V supply.

Due to excessive work hours I have been unable to spend any time in the shop for the last month or so. When I get back to it I'll post my findings and, hopefully, the cure. If/when you resolve your problem please post your results.

73,

Ken, WA2LBI

OK Barry, I was thinking of getting the 12 volts from the TS-830S. Same circuit the other bulbs are on. This way when I turn on the TS-830S the meter in the AT-230 would light up at the same time. I am going to look inside the AT-230 to see the best place to locate the bulb because I do not think the meter has a place to mount a bulb. I will let you know what I come up with Barry.

Good explanation of neutralization and matching tubes, Walt; better than mine a couple months ago. Tube matching is not well understood, but is less of an issue with the 6146 family of tubes than with the various sweep tubes, which are not made with the close tolerances of the 6146's. Matching is essential with sweep tubes and preferable for 6146's.
Because of accessability of the control, I find the Kenwood hybrid rigs the most difficult to neutralize of any I have.

Check VR4 on the AF Board. It probably needs to be cleaned. Tap it
lightly and see if it brings the 830 to life.
Another possibility is the contacts at the connectors on the AF board.

9081. RE: [TS-520_820_530_830] TS830S No Drive on 30m

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-28 01:29:04 UTC
From: Ron Hauser
Topic: 7936 Message: 9081

Replying to my own email... I did a bit more tracing today after the comments below. The output of the balance mixer, and specifically the output of Q6/Q7, is the same as the input to the driver tube... So I have this discrepancy coming out of Q6/Q7. On 14110, about 1.5v RMS. On 7110 about 1.5v RMS. On 10110, over 5v RMS. I'm working my way through the circuits around Q6/Q7, there has to be a component that has gone bad that is messing up the bias on these perhaps? Anyone who has experience (or just random ideas) I would appreciate your thoughts. I've never been this deep in an electronic troubleshooting excersize before.

Thanks!

Subject: [TS-520_820_530_830] TS830S No Drive on 30m

Greetings Kenwood Gurus. About two months ago I was working along with Joe Sloss K7MKS, Bill Schurlock KG5CW, and Joan from Down Under VK5KYO. Bill helped get me set up with a VTVM, I eventually got an RF probe made, and finally I have done some testing.

The problem:

I have a TS830S that I got from the previous owner about a year ago. There is no drive at all on 30m, no matter the position of the drive control knob (also no RF out). All other bands produce drive (and I've had QSOs, seem to be working fine). It receives just fine, I've listened to WWV and various CW and digital QSOs on 30m. I have verified that the WARC bands have been enabled by snipping wire #1 on connector #6 according to the manual. I've tried lots of wiggling of the bandswitch, also poking carefully at the bandswitch contacts, also tested resistance on the bandswitch contacts which are outside the finals cage. No wiggling ever gives a twitch of drive, and all the contacts outside the finals cage show continuity. On receive the drive control does peak the signal.

Based on Joan's problem with a missing band, I tested C74 and L36 on the RF board. I believe that both these components are ok -- L36 showed right at the 4 ohms level Joan was looking for, and C74 is not shorted and doesn't look burned or anything.

I then took Joe's advice and attempted to measure the RF voltage on the grid of the driver tube. I believe this is a promising path, but I must first verify that I measured on the _correct_ pin. So. I have the radio sitting right side up on the bench with the covers off, the RF board is exposed and the driver tube is right there in the middle. I'm looking down at the tube/socket from above -- actually I am also looking at the board layout diagram in the service manual, which is the same orientation of course. I'm a little fuzzy on the "proper" numbering order of the pins. But anyway in this orientation the gap with no pins is at 9 oclock. There is a pin at 8 oclock, one at 7 oclock, one at five oclock. After staring at the diagrams and thinking about it for a while, I believe the pin at 7 oclock is the one that I want. So I put the rf probe on that pin and with the rig in tune, I switched to send and indeed I got RF.

Question #1. Am I on the right pin (or if not what am I measuring!?!)

Question #2. If I am on the right pin, I have an interesting result, because the RF voltage is not the same. At 14110 kHz I got 1.5 V. At 7110 kHz I got 1.4 V. But on 10110 kHz I got 5.2 V. Hm!!!

Cc: TS-520_820_530_830@yahoogroups.com
Subject: [TS-520_820_530_830] TS830S No Drive on 30m

Hi Joe, understood. I had come to a similar conclusion this afternoon after our previous emails; a VTVM would be very handy right now. I'm going to proceed as recommended, I will build an RF probe to use with my DMM. I will also keep an eye out on Ebay and the other sites for a VTVM which is what I really need. Using whichever of those I get hold of first I'll start tracing as you recommended.

To restate the problem for future reference: I have a TS830S that I got from the previous owner about 8 months ago. There is no drive at all on 30m. All other bands produce drive (and I've had QSOs, seem to be working fine). It receives just fine, I've listened to WWV and various CW and digital QSOs on 30m. I have verified that the WARC bands have been enabled by snipping wire #1 on connector #6 according to the manual. I've tried lots of wiggling of the bandswitch, also poking carefully at the bandswitch contacts, also tested resistance on the bandswitch contacts which are outside the finals cage. No wiggling ever gives a twitch of drive, and all the contacts outside the finals cage show continuity. On receive the drive control does peak the signal. Therefore my current thinking is to look for trouble somewhere besides the bandswitch, my best thought being to check C74 and L36 on the RF board as noted by Joan VK5KYO.

I've changed the subject to more accurately reflect this issue, so that it will be easier to find in the future. I will have some time to work on the radio again tomorrow, then I'm out of town for vacation and for work for a few weeks. I'm archiving all these conversations so that I'll be able to

come back to them.

I appreciate your coaching.

To: Ron Hauser
Subject: Re: [TS-520_820_530_830] TS830S low power

Ron: There are several Heath RF probes on ebay that could be adapted to use

with your DMM. Handiest thing in the world when you need one.

The fact that your DRIVE control peaks a received signal tells me that the
BS and associated circuits on 30m may be OK.

I was going to ask you to measure RF voltage at the grid of the driver tube.

Do this on 40 and 20 when you are in the TUNE position. Then check 30m.

If you have about the same RF voltage then the 30m circuits BEFORE the grid

are working correctly. If the 30m voltage is lower or non-existant then
your problem is before the grid of the driver tube.

Before I go too far you might refresh my memory as to the problem you are
having. I think I've deleted some of your earlier comments on what was
wrong and what does what.

Topic: 9057 Message: 9083

Walt, Mr. Guru of the Kenwood,

Once again, you've explained it far better than I could have. Many Thanks.

73,
Ellen - AF9J

P.S. - as you well know, neutralization is a non-event, if done properly. I had no problems neutralizing mine (it's just tedious to do). Now she's humming along sweetly at 100-115W output (depending upon the band).

9084. Re: VFO-240 Cable

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-28 04:43:07 UTC
From: Gordon
Topic: 8867 Message: 9084

Hi Bill and group,
Thanks for all the info. Seems the fellow I bought the rig and VFO from found the Cable and sent it to me Via Priority mail. Very nice guy! Plugged the cable in, and it all works great. I'm waiting on some replacement band switch couplers, then I'm going to sell this 830 and VFO-240 to buy some more rigs to work on.. hi hi...
This has to be one of the nicest 830's I have ever seen and it works GREAT ! I wanted to keep it, but if I do, I won't be able to buy more "Projects" that need my help. I enjoy fixing these hybrids !!!

73 and thanks guys,
Gordon
N6WK

I believe you are correct in that the pins appear to be wired direct pin-to-pin on each end of the cable. Here is what I found for the 8 pin remote vfo sockets on the radios and on the VFO's.
>
> Pin 1 - the "hot" Remote VFO signal going to the PLL Unit connector 6 pin 1 (TS-530S). Note that the radio internal VFO signal goes to connector 5 pin 2 (PLL Unit).
>
> Pin 2 - Identified as "RL" going to the AF Unit connector 6 pin 6 (TS-530S). Also identified as "RL" in the VFO-240 and VFO-230.
>
> Pin 3 - Identified as "9" (volts?) going to the AF Unit connector 6 pin 7 (TS-530S). Also identified as "9" in the VFO-240 and VFO-230.
>
> Pin 4 - Identified as "RLC" going to pin 1 of the VFO Assembly X60-1150-01 plug of the internal vfo (TS530S). There is no connection to pin 4 for VFO-240, but there is a connection in the VFO-230.
>
> Pin 5 - Identified as "VFB" going to pin 3 of the VFO Assembly X60-1150-01 plug of the internal vfo (TS-530S). The connection to this pin 5 for the VFO-240 is identified as "MCO". In VFO-230, this signal is identified as "VFB".
>
> Pin 6 - Identified as "0.5" going to the Counter Unit X54-1540-00

connector 1 pin 2. There is no connection to pin 6 for VFO-240, but
there is a connection in VFO-230 identified as "5.00".
>
> Pin 7 - This is a ground connection used to shield the "hot" vfo
signal lead.
>
> Pin 8 - Identified as "12" in the TS-530 and goes to several places
including the Counter Unit connector 1 pin 3, and the RF Unit
connector 6 pin 2. In VFO-240 this signal is identified as "14" and
provides power to PL1 and PL2. There is no connection to this pin in
VFO-230.
>
> I used the interconnection/schematic diagram for the TS-530S for the
above references because Kenwood drew it line-for-line , whereas the
TS-830 diagram draws one line for multiple conductors where you have
to follow all the "breakouts" to figure out where the conductors are
going which is a little more time consuming.
>
> It appears that you can use a 6 conductor cable if you only plan to
use the VFO-240, or a 7 conductor cable if you only plan to use the
VFO-230. But if you plan to use the same cable for either VFO, then
you will need to use 8 conductors. The VFO-240 is made to use with
either the TS-530S or TS-830S.

Don't go back go forward. Think about it, 5v = no load after Q6-7. A
high reading indicates no load. Something is not there after the
mixers. Most likely a bad connection on a bandswitch.

9086. TS-820 Finals draw excessive current

Yahoo group: TS-520_820_530_830 (2006)

Mike:
Does the tube draw current by the light bulb test if the SG switch is OFF ?
If not I think that before you buy another set of tubes, unless you just want them as spares, we need to check your control grid bias.

Go to the bottom of the board called the Final Unit. That is the board that the tube sockets are on. There is a point called FG. (do NOT confuse this with SG) Turn the rig on with the SG switch off. Measure the voltage at FG. This should be a MINUS voltage probably around -100v on receive.

If it is not there, locate the RF board. This is the board that the 12BY7 is on. Locate Q5. It is a 2s1515. Remove it and check it.

To check a transistor with an ohm meter:

The 2sc1515 is an NPN transistor. In your lowest ohms setting, connect the black lead to the base of the transistor. Connect the red lead first to the emitter and then to the collector lead of the transistor. The ohm meter should show continuity (low ohms) from the base to the emitter and from the base to the emitter.

Now place the Red lead to the base and The black lead first to the emitter and then to the collector. This time you should read an open circuit.

Now, to those of you who think this seems backwards, most ohm meters have the positive source on the black wire and the return to the meter on the red wire when in the ohms position. The operative work is MOST. So if you get the exact opposite response as above don't worry about it. Also a PnP transistor will check the opposite way.

If you have low ohms both ways from the base to either transistor lead, the transistor is shorted. If it checks open both ways it is open.

Gordon, seems to me that we have been to this rodeo before.

So Mike, if the rig draws excessive current with the SAG switch off, stop and get back with us.
If it does not draw excessive current with the SAG switch OFF, proceed checking as above.

Now for the educational part of today's show:

Explanation Of Control (g1) bias.

Most tubes will draw lots of current if the control grid is at ground potential or near the same potential as the cathode. We place negative bias voltage on this grid to stop the grid from conducting. This is sometimes called Grid Block.

When we transmit we want the tubes to draw 60 ma but no more when there is no RF drive such as is the case when keyed on SSB with no modulation. So we reduce the negative voltage to a lower negative number until the tube is allowed to draw the needed 60 MA. This is done with the bias control and is what you are doing when you set the idle current.

If the minus voltage is not present due to some failure, the tube will draw a lot of current and self destruct.

For those who are working on their general, some olde tube type CW transmitters turned transmit stages off by using Grid Blocking and removed this Grid Block when the key was down allowing a signal for CW operation. This is called Grid Block Keying.

Subject: RE: tubes

I put the $5 tubes in and fired up the radio. The light in the tester still gets real bright after 10 seconds when the heaters are turned on and the SG is on. Either I bought a bad set of tubes which is very possible or there is a short somewhere else. I unsoldered the 10 Ohm resistors and they both tested 10 Ohm out of circuit. I also put the Ohm meter across all the high voltage caps and they did not show a short. I looked around the entire radio and can not find any burnt components. Is there anything else I should check? Perhaps I just need to buy a known good set of 6146B's before going on?

I did look at the file in the files section entitled "checking 6146's" with an ohm meter. I did all the checks and all the tubes passed, even the melted one.

Mike
KC8QNO

FYI: Mike found a set of tubes that seem new for $5.00

Ron:
You need two signals to the mixer Q6 and Q7. One is the VCO signal, the other is the signal from TIF. TP 5 is a place to check for the VCO signal. The VCO feeds T3, the IF feeds T4. The balanced mixer mixes these two to get the fundamental output. Are both signals present ? Can you hear it send a carrier on a nearby receiver? Must be in CW or Tune of course.

Subject: RE: [TS-520_820_530_830] TS830S No Drive on 30m

Replying to my own email... I did a bit more tracing today after the comments below. The output of the balance mixer, and specifically the output of Q6/Q7, is the same as the input to the driver tube... So I have this discrepancy coming out of Q6/Q7. On 14110, about 1.5v RMS. On 7110 about 1.5v RMS. On 10110, over 5v RMS. I'm working my way through the circuits around Q6/Q7, there has to be a component that has gone bad that is messing up the bias on these perhaps? Anyone who has experience (or just random ideas) I would appreciate your thoughts. I've never been this deep in an electronic troubleshooting excersize before.

Thanks!

Subject: [TS-520_820_530_830] TS830S No Drive on 30m

Greetings Kenwood Gurus. About two months ago I was working along with Joe Sloss K7MKS, Bill Schurlock KG5CW, and Joan from Down Under VK5KYO. Bill helped get me set up with a VTVM, I eventually got an RF probe made, and finally I have done some testing.

The problem:

I have a TS830S that I got from the previous owner about a year ago. There is no drive at all on 30m, no matter the position of the drive control knob (also no RF out). All other bands produce drive (and I've had QSOs, seem to be working fine). It receives just fine, I've listened to WWV and various

CW and digital QSOs on 30m. I have verified that the WARC bands have been enabled by snipping wire #1 on connector #6 according to the manual. I've tried lots of wiggling of the bandswitch, also poking carefully at the bandswitch contacts, also tested resistance on the bandswitch contacts which are outside the finals cage. No wiggling ever gives a twitch of drive, and all the contacts outside the finals cage show continuity. On receive the drive control does peak the signal.

Based on Joan's problem with a missing band, I tested C74 and L36 on the RF board. I believe that both these components are ok -- L36 showed right at the 4 ohms level Joan was looking for, and C74 is not shorted and doesn't look burned or anything.

I then took Joe's advice and attempted to measure the RF voltage on the grid of the driver tube. I believe this is a promising path, but I must first verify that I measured on the _correct_ pin. So. I have the radio sitting right side up on the bench with the covers off, the RF board is exposed and the driver tube is right there in the middle. I'm looking down at the tube/socket from above -- actually I am also looking at the board layout diagram in the service manual, which is the same orientation of course. I'm a little fuzzy on the "proper" numbering order of the pins. But anyway in this orientation the gap with no pins is at 9 oclock. There is a pin at 8 oclock, one at 7 oclock, one at five oclock. After staring at the diagrams and thinking about it for a while, I believe the pin at 7 oclock is the one that I want. So I put the rf probe on that pin and with the rig in tune, I switched to send and indeed I got RF.

Question #1. Am I on the right pin (or if not what am I measuring!?!)

Question #2. If I am on the right pin, I have an interesting result, because the RF voltage is not the same. At 14110 kHz I got 1.5 V. At 7110 kHz I got 1.4 V. But on 10110 kHz I got 5.2 V. Hm!!!

Subject: [TS-520_820_530_830] TS830S No Drive on 30m

Hi Joe, understood. I had come to a similar conclusion this afternoon after our previous emails; a VTVM would be very handy right now. I'm going to proceed as recommended, I will build an RF probe to use with my DMM. I will also keep an eye out on Ebay and the other sites for a VTVM which is what I really need. Using whichever of those I get hold of first I'll start tracing as you recommended.

To restate the problem for future reference: I have a TS830S that I got from the previous owner about 8 months ago. There is no drive at all on 30m. All other bands produce drive (and I've had QSOs, seem to be working fine). It receives just fine, I've listened to WWV and various CW and

digital QSOs on 30m. I have verified that the WARC bands have been enabled by snipping wire #1 on connector #6 according to the manual. I've tried lots of wiggling of the bandswitch, also poking carefully at the bandswitch contacts, also tested resistance on the bandswitch contacts which are outside the finals cage. No wiggling ever gives a twitch of drive, and all the contacts outside the finals cage show continuity. On receive the drive control does peak the signal. Therefore my current thinking is to look for trouble somewhere besides the bandswitch, my best thought being to check C74 and L36 on the RF board as noted by Joan VK5KYO.

I've changed the subject to more accurately reflect this issue, so that it will be easier to find in the future. I will have some time to work on the radio again tomorrow, then I'm out of town for vacation and for work for a few weeks. I'm archiving all these conversations so that I'll be able to come back to them.

I appreciate your coaching.

Subject: Re: [TS-520_820_530_830] TS830S low power

Ron: There are several Heath RF probes on ebay that could be adapted to use

with your DMM. Handiest thing in the world when you need one.

The fact that your DRIVE control peaks a received signal tells me that the BS and associated circuits on 30m may be OK.

I was going to ask you to measure RF voltage at the grid of the driver tube.

Do this on 40 and 20 when you are in the TUNE position. Then check 30m.

If you have about the same RF voltage then the 30m circuits BEFORE the grid

are working correctly. If the 30m voltage is lower or non-existant then your problem is before the grid of the driver tube.

Before I go too far you might refresh my memory as to the problem you are having. I think I've deleted some of your earlier comments on what was wrong and what does what.

Regards,

Gordon,

Just curious where you got the couplers from. An old trick I use is to
buy a piece of 1/4" aquarium hose and the smallest compression clamps
you can find. Cut the hose to length giving about 1/2" on each side of
coupling and put one compression clamp to each shaft. Not as pretty as
a new coupler but works just fine.

Actually, the Master Guru is Bill K0ZL.

You and Gordon are getting real sharp with these rigs. I am pleased to see that this Yahoo Group is proving that Hams can be more than just appliance operators who are dependent on the UPS man for repairs.

There are also many others here that we all learn a lot from that have a great deal of electronic knowledge..

In the early days, hams had Elmers in their area that helped them. I had Elmers when I was young. What these Elmers didn't realize at the time, is that they taught me a skill that would pay my bills for the rest of my life. In our fast pace world one on one local Elmering is not as easy as it once was. But with the internet, Hams can get together with Elmers all over the world. If a little help is available, it is not so scary to attempt a repair. I am a person who learns best by doing. I think a lot of us are.

I thank every member for their contribution of knowledge, big or small. This is like a big worldwide Kenwood think tank. I sure am learning a lot!

BTW, this little group has 1054 members.

There must be a lot of these Kenwood Hybrids out there still in use. Every day my respect for this generation of rigs increases. I wonder how many of the rigs manufactured today will still be around and operating in 30 years ?

Walt, Mr. Guru of the Kenwood,

Once again, you've explained it far better than I could have. Many
Thanks.

73,
Ellen - AF9J

P.S. - as you well know, neutralization is a non-event, if done
properly. I had no problems neutralizing mine (it's just tedious to
do). Now she's humming along sweetly at 100-115W output (depending
upon the band).

I wonder how many of the rigs manufactured today will still be around and operating in 30 years ?

Walt, I have thought this same thing. There must be a bunch. I saw a half dozen at the Joplin, Mo. hamfest last Saturday, in various states of disrepair. A couple went for $75. for parts or repair, and then some were pretty pricey (and didn't sell). Several folks mentioned they were good ole radios and still were. So, lets hope they keep on going and going and going......

My concern is more like how many of the operator/owners will be able
to remember what all the buttons do 30 years from now.

" My concern is more like how many of the operator/owners will be able to remember what all the buttons do 30 years from now." <snip>

Some of us (Ahem, myself included) have trouble figuring out what the buttons do today (much less years in the future). Most of what we call radios are actually computers that happen to have an RF output. Steep learning curve for us oldtimers. And from my perspective, hamming is not as near much fun when the machine does it all for me. Guess that's why I like the old rigs so much.

I can tell you from a new ham perspective (I'm 28 yrs old and been a ham for 5 yrs). I really like this old TS-820S and I have never even used it. It looks like a real radio and it has vacuum tubes which fascinate me. I can't wait to get it fixed so I can try it out and I wanted to learn something about RF. I could not think of a better way than to buy a broken old radio. Once I get this fixed and working, I plan on buying an Elecraft K2 this winter. Building my own radio sounds like a ton of fun.

As a new ham, licensed for not quite two years, I find that I am learning a lot both by operating and by working on these radios. My first radio was an IC706 which is a very nice radio and is now in my van. But after operating and working on my Kenwoods, I have a much better understanding about what those menu options and buttons are _actually_doing_ to the signal in my IC706. Everybody can choose which areas they wish to study, what they want to learn... So some people may choose to be hams and not learn all the intricacies of their radios. I feel very lucky to have these radios, and the email-elmers in this group to make it easy to get down into the intimate details for those of us who wish to!

Took possession of a very clean TS830 with AT230 and SP230 today. Rig is in excellent shape and has the optional CW filters in it. Will pop the covers off today after work and blow it all out and check the goodies. Will be putting the 3 khz SSB filter over the next couple of days. I'm looking for the matching VFO-230 or VFO-240 if anyone has one available.

Max

9096. no/low TX on TS-520

Yahoo group: TS-520_820_530_830 (2006)

hi again I posted a slack tuning knob on a TS830 M rig i have repaired/restored .I had a few replies to say that most 830s had this feel . Well I took the vfo to a friend who spends his hobby time turning in metal and model building for a opinion . In short he cut a piece of quarter inch ally plate Reamed this to be a snug fitt on shaft and this was bolted to front off v f o [countersink existing srew fixings to allow plate to lay flat] and remount vfo front. feels solid and turns ok . not a purist soloution but a good fix!.

I want to use a microwave modules 2 meter transverter, feeding this from the 830 skt at rear . What drive power at 28mhz is availiable and what else is on the skt ?. the m m convertor requires less than /no more than 1watt. regards bob G8ACQ

Mikefr24, just DO NOT get across the high voltage on the radio. It packs a lethal and fatal punch.

Read all about the radio in the Operators Manual before you ever take the top off. Its not a 12 volt radio. You may know more about the radio than I do at this point, however, just a word of caution.

I let some stuff fall across the high voltage on an old Swan one time years ago, and it shorted and I thought a volcano had erupted in the shack.

Yes and your absolutely right about that, Mike. Thank You for the reminder. I've been bit and I kmow what it feels like. I got it from a flyback transformer on a large old television set in a wooden cabinet. It knocked me to the floor.

That's why my one linear has a switch that when you open the PA Box while the power is on it shorts the plate on bypass instantly.

I learned over the years to use one hand in my pocket technique. I prefer someone in the room in case something happens. They kind of get annoyed with me, especially when they can't figure out what I'm talkin about, but usually I'm talkin to myself any way. So long as they get me off that power some how. That's alot of the battle. Then comes the revival.

Many times I got bit. Just the three or four days ago I got bit by 220 again, trying to remove a breaker in a box. I get reminded every now and again. That's why when I'm around some one who's taking that same chance, I stick around. One of the first things I look for is a broom handle or some wooden handle, something insulated. Only had to it once. Guy dropped a screwdriver in a broadcast transmitter we were testing. Blew a big hole right thru his hand and out his elbow. After that, I stopped drawing arcs for laughs with a screwdriver back several feet off the load-line.

I've also seen sparks fly down a multi-pass acryl-tower when the heating elements shorted on 440. hot metal and pieces of ceramic and asbestos everywhere. Jumped right thru a shower of sparks like a waterfall to get out of there.

I've seen power on electric poles jump the insulator and run down the pole and start a field fire. The lines fell down and struck large rocks shattering them into tiny pieces in a huge explosion every time the line bounced to the ground. Like a hanging snake.

And lightning. within 15 feet of me. A sonic boom, like a shock wave for at least 30 feet around. How I survived that as a kid I'll never know. I ran from that barn and the buzz as that bolt hit behind me where I was as my mom looked on, Mom beat the crap out of me for that one.

Yes I always take it well when someone reminds me. It seems I'm always the one out on point. Thanks again.

Jon:
What happens on the ALC meter if you try to peak the drive control? Be sure that the car is all the way up. Are the final tube filaments lighted? What about the 12BY7 ? Turn the lights off and look closely. If you have the cover off the final section, be careful, there is 800V in there even on receive.

Go to SSB and key rig. Observe the IP meter while moving the bias control from one extreme to the other.
After you do these checks, we will come up with some more ideas. Do you have a volt/ohm meter ?

Well actually your getting to learn the pros and cons of both the tube vintage era, and the solid-state by these examples. The solid-state which is portable with it's many menus on some and a SWR that's a little more sensitive despite mobility and portability. On the other hand you get to see the tube world, which has The ability to accept little higher SWR for slightly less efficiency despite having to re-tune.It also must stick to the AC mains a little closer unlike it's 12 volt counterpart.
The best part about it all I believe is the fact that you will see something in history that probably commercially, will never occur again.The hybrid, a merger of the two technologies; actually working as a team to produce an effective communications medium. We could look back and say yes we could improve this and maybe that could make it work better. But it's not like the things that come back out of nostalgia. Kenwwod will never make an updated version and do away with mechanical bandswitches or better power regulation than say some of the newer models any digital additions will be aftermarket product add-ons. It'll never run CAT via PC.
It's not the same Harley you turned every nut and bolt to keep it tight, and it's not the revival of the folksvagen. You're experiencing a part of history here, every time you send a good clean signal on the air it keeps that good reputation that has been known year in and year out.Spark gap may no longer be on the air, CW is now something only we Hams use. Even the transistor passed now by new technology making it as obsolete as 8-track tape players. But you are there to man's improvements with each dawning day. It's like a museum will someday put our display up too, in a day and age when noone will remember if a studebaker was a foreign or domestic car.

That's why I stay here. Like each piece of a puzzle makes a good picture. Like a team we all have our given gift and the combination however large or small, produces a winning solution. We have to take care of our group. There's not much to the alternative. Where somtimes one may have a knowledge or even several. But also you may find the parts you need.

n9wb <n9wb@...> wrote: Actually, the Master Guru is Bill K0ZL.

You and Gordon are getting real sharp with these rigs. I am pleased to see that this Yahoo Group is proving that Hams can be more than just appliance operators who are dependent on the UPS man for repairs.

There are also many others here that we all learn a lot from that have a great deal of electronic knowledge..

In the early days, hams had Elmers in their area that helped them. I had Elmers when I was young. What these Elmers didn't realize at the time, is that they taught me a skill that would pay my bills for the rest of my life. In our fast pace world one on one local Elmering is not as easy as it once was. But with the internet, Hams can get together with Elmers all over the world. If a little help is available, it is not so scary to attempt a repair. I am a person who learns best by doing. I think a lot of us are.

I thank every member for their contribution of knowledge, big or small. This is like a big worldwide Kenwood think tank. I sure am learning a lot!

BTW, this little group has 1054 members.

There must be a lot of these Kenwood Hybrids out there still in use. Every day my respect for this generation of rigs increases. I wonder how many of the rigs manufactured today will still be around and operating in 30 years ?

Walt, Mr. Guru of the Kenwood,

Once again, you've explained it far better than I could have. Many
Thanks.

73,
Ellen - AF9J

P.S. - as you well know, neutralization is a non-event, if done properly. I had no problems neutralizing mine (it's just tedious to do). Now she's humming along sweetly at 100-115W output (depending upon the band).

Yes we have Walt. On the one I was working on, It turned out that the connector to the Relay Board was bad and not pulling the circuit down when the relay closed. I replaced some connectors on the relay board and all was well. Mine was on an 820 though !

I'm thinking Relay or bad connectors/Terminals on the Board
connectors.. I know Bandswitches will also produce some strange
results when not clean. I wonder if there is 800 volts at the Plate on
the tubes? Just because the meter says 800, doesn't mean it's getting
to the plates.

Plates are over 800 volts measured at the tube.Cleaned the
relays,been checking wire solder terminals so far not a thing.

I'm getting closer! The 0 ma reading on the ALC in tune mode was caused by resistors R5 & R6 on the HV board being as much as 40% or higher out of range. I still have low rf out in CW mode.Yes, I've cleaned the band switches by use of spray cleaner,I did'nt take them apart for fear not getting them together again.ALC stays 1/4 scale with CAR on full but does reduce with reduction of CAR.I'm getting pretty sure the problem might be R70 & R71 on the rf board going up in value, but I'm nervous about attempting removal of the RF board to get at them, even to test them cause they are buried so deep.
Any thoughts?

Well, that take scare of the question of Plate Voltage at the tubes.

Have you verified that each of the circuits in RL1 switch when going
from Receive to transmit ? How about R3 and R4.. are they good ?

Well, R71 and R70 should be easy enough to check by just checking the voltage at pin 8 of the Driver. Check to see if the 210 voltage in, on the Rf board is 210 (or close). Have you checked the Rectifier board to be sure there are no bad (Cold) solder joints there on the Diodes?

Are you getting 210 and 300 respectiuvely out of the rectifier board ?
I have found a bunch of rigs with bad solder joints on the Diodes of the rectifier Board.
I see you have been looking at the HV Unit, But I suggest looking closely at the rectifier Board also.

Gordon

As far as R70, --- In TS-520_820_530_830@yahoogroups.com, "jon_77449" <jledbetter8@...> wrote:

Jon, The more I study the Circuit, The more I am convinced there is something on the Rectifier Board. The 210 Volt circuit feeds the R5 and R6 on the HV unit Board directly, Go back and check the 210 Volt circuit coming out of the rectifier Board. I'm betting that there may be a problem with R6 (Open) on that Board..
Just an Idea.....

9116. MC-50 Cord

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-29 02:19:45 UTC
From: Ken Franke
Topic: 9116 Message: 9116

Friends and Neighbors,

I am looking for a mic cord for MC-50 (Base to Rig).
Anyone still making those still. I can't find the
5 pin base plug anywhere.
Got my TS-820 I had as a novice(1980) back from a ham
that borrowed it 15 yrs ago. Still looks brand new.
Will try to find complete station and set up separate
station in shack.

Finally, there is alot of good information on this group.
Ready for CW QSO's any time with 820. Just email.

Sincerely,
Ken/N5EBD

Topic: 9126 Message: 9126

I would like to thank everyone for the help and advise that I got. I doubt I would have fixed the radio if I had not found this forum. My problem was all in the RF board. One of the 3 cables was unplugged this whole time. It looked plugged in but when I went to take that board out, I noticed that it was just barely inserted in the socket. When I plugged it in, everything came to life and the tubes stopped blowing fuses. I still have a slight tube problem. I can only muster 50 watts out of the finals. One of the tubes has a hole in the plate and I am sure it is not working. I will install my new set of tubes this evening and neutralize them. I will post again when I get that all done.

Special thanks to N9WB for his expertise with this radio and vacuum tubes!

Odd, now it is reading 800V Hmmm!. Perhaps it is the watt meter on the tuner that is reading low?

Max,

Walt has probably provided the answer. I have a TS-530 at the /P location that I use at weekends which often shows 750V HT with the AT-230 meter showing 80W. Investigating why this was so, I checked the AC line voltage and it was 213V - UK voltage is nominally 230V and the transceiver may be set for 240V operation, although I haven't checked that.

I don't think so Walt, perhaps I read it wrong.

After getting the 830 home, I proceeded to remove all knobs, switches and the front panel for a good soaking in dish soap and hot water. I like to tighten up all the controls at this point too. Well I noticed the mode switch was very loose and looked like it had been cross-threaded. Well the darn thing broke when I tightened it. The threaded portion of the shaft broke away from the switch. I managed to solder the small anti-turn tab to the front chasis and the threaded part is back on the shaft and soldered to the top side of the panel for stability. So I need either a new mode switch or suggestion and securing this one to the chasis. So if anyone has an 830 they're using as a parts rig or someone has this switch in their junkbox please let me know.

No problem Mike,

It's a great forum. The people in this forum, helped me to get my baby up and running again, too. In the process, I had the opportunity to learn some things about how my TS-820 works, and was left with the good feeling of knowing that I fixed my 820, and that it's on the air because of my work. Like you, I never would have pulled it off (or I would have had a much harder time), without the help of this group.

Just out of curiosity, does your TS-820 have the optional digital display, or is just in dial readout form like mine is?

73,
Ellen - AF9J

Roberto,

You need to interface your keyer to the rig's keying
line with something like the Jackson Harbor Press's
"Keyall"
http://home.att.net/~jacksonharbor/keyall.htm
The kit goes together in a few minutes and works very
well.

I don't belive that's correct - you should be able to key the 520
directly. Just plug it in.

Older keyers are built for "grid-block" keying with the higher voltages as
used in a 520. I used to have one of those keyers and used it directly
with my 520 as well as with a Heathkit Apache.

Some of the older MFJ or other keyers also support this. They sometimes
have a jumper somewhere to pick the type, or have two outputs on the back.

There is a manual at http://bama.sbc.edu/heath.htm you can download and
check the specs.

The transverters for the 520 series are the TV-502 (2 meter) and the
TV-506 (6 meter). They don't come up on e-bay very often. If you get
one make sure that you get the interconnect cable with it. Thats the
rare item! Its also very difficult to make a replacement cable
because the 12 pin Hirose connectors don't seem to exist. You can
get 8, 10 and 16 pins but not the 12. Also in the 520 series only
the 520 and 520S have the connectors built into the radio. The 520SE
has the pin outs on the circuit boards, but Kenwood chose to not
hook anything up to them. I'm still working on converting
(retrofitting?) my 520SE to run a TV-506 that was given to me by a
friend.
Have fun,
K7MEI
Brent

Good luck finding a Kenwood transverter. I've been looking
for one for six meters for a while now, with no luck.
I've pretty much resigned myself to buying a six-meter
rig, or a combo HF/6 like the TS-570S(G). I won't give
up my 830, though. Ever since I tightened all the screws
inside, it's been like new.

Ken, that the same result I had with my 530S, just gave everything a good tightening and away it went. I'm waiting on the brass sleeve for the bandswitch repair from K4EAA to complete the project. It works but I have to kinda' find tune the bandswitch toward the edge to make a connection.

Hi Max,

I am not familiar with how the RigBlaster uses it's keying line. The logging program that I use has a +5vdc 'pulse' output from a serial port to use for CW keying. I use a NPN switching transistor soldered right in the hood of the serial plug on the PC to a 1/4" plug into the key jack on my 830S. The problem with the Kenwood hybrid radios is there is -65vdc potential on the keying line of the Kenwood and most transistor circuits will not handle that. It exceeds the rating of the switching transistor. I have some MPS-A42 NPN transistors rated at 300vdc and used one and it works fine.

Topic: 9135 Message: 9146

Plugging it straight in just keys down the '820. I am aware of the -65VDC The Heath manual says "Note: This keyer is designed to be compatible w/most rigs that use solid-state keying circuits as well as those that use grid-block or cathode keying. However, some solid-state keying circuits require the key line to be brought within a few tenths of a volt from ground to operate properly. If this Keyer will be used exclusively with one of these rigs, remove resistor...diode...jumper. This will reduce voltage drop across the Vce of Q6." Well, not an issue here.

Specs:
Keyer output Pos. line to gnd:
Max v., open ckt or spikes - 200v
Max current - 200mA

Negative line to gnd:
Max v, open ckt or spikes -200 v
Max current -10mA

Gentlemen
On one of my rigs I had to change the polarity on the plug to make it key properly.

I have the digital display installed. It had problems not working
half the time but a little Deoxit and tightening the screws did the
trick.

I was thinking that also about the RECT board. On the HV board I had to unsolder one end of each resistor to check and found 4 bad, now I'll check the Rect board.

Have you checked that your DC voltmeter has a proper RF blocking
inductance/filter?

9153. RigBlaster CW Keying Circuit

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-29 20:42:20 UTC
From: max_ve3tmt
Topic: 9153 Message: 9153

According to my RigBlaster manual the CW line is keyed with a
Fairchild CNY17-3 optocoupler. Here is a link to the data sheet:

http://www.ortodoxism.ro/datasheets/fairchild/CNY17-3.pdf

Can someone look it over and offer their opinion as to whether or not
it would be suitable for keying the 830.

Thanks,

Max

9154. can HF transmit overload UHF/VHF radio?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-29 20:49:39 UTC
From: Valued Customer
Topic: 9154 Message: 9154

Hello group. I hope this isn't too far off topic, but I know there's a lot of smart cookies in here!

I'm wondering if my VHF/UHF handheld can be damaged (or other problems!) from the HF inverted-V dipole if they're in the same 'field' of each other? The mag-mount is within the V of the antenna and the closest distance is about a foot from one of the dipole ends.

The HF dipole is four wires, tuned to 20m and 40m, while the handheld is a dual-band UHF/VHF mag-mount.

I keep the handheld running 24/7 for streaming the local repeater to the internet and wanted to make sure that when I'm using my TS-520 on full power (100w), it won't fry my little radio!

73, Frank K2NCC

hi ron,

yes, they are scarece but do turn up once in a while on ebay
and qth.com sites. $ 125-$ 250 depending on condition.

save searches in ebay for transverter, tv*502, kenwood 502
and you can get email when they pop up. Be sure to get the
cables otherwise it will be more work to find the hirose male
connectors and make them up.

I've got the transverter manuals at hamftp (aka RUBE) and
at mods.dk if you want to take a look at the specs.

I have the 2m and the 6m transveters, 2m is quiet in fm05
but 6m is a lot more active.

You were right Gordon! R8 for the SG measured 20-40% to high,R5 &
R6 measured right on,R1-4 some measured around 1.5meg! should have
been 470k.I may not finish today....XYL,you know how that goes. I'll
update more later.
Thanks!

I've been using an LT 6S SSB Electronic transverter with my 830 for
years. 830 transverter output feeds the transverter without any problems.
SSB Electronic has a whole series of transverters. Color and style don't
match, but I was looking for performance and reliability, so that wasn't
a consideration. So, your choice is, have it match cosmetically or
perform well.

James,
Did you ever find a source for the Hirose connectors? I know I
haven't. I would prefer the OEM style when I retrofit my 520SE,
which means both male and female connectors. Otherwise I'll go with
a more modern connector and modify the 506 as well by jumpering
over from the OEM port.
Thanks,
Brent K7MEI

Jon, if my memory serves me from the "olden days" the 12.6 is AC, do you have your meter on the AC range. Someone correct me if I'm wrong.

Yes it was AC and reading correct.Pin 1 is reading low, should be .05 on RX and 1.3 on TX and its .01 and .31volts and of course the same on pins 4 & 6 since their wired together. pin 7on V1 should be 6.3volts AC and I'm getting 5.4v. Pin2 of V2 should be6.3v AC and I'm getting 5.4v AC. All others I think are OK.

From: james27613
Topic: 9125 Message: 9164

Hi brent,

I remember another post on these hirose connectors,
someone found them at a dealer in the UK.

my tv-502 came with the cable for the tv-506, I added the
rca pigtail for the connection to the jack on the ts-520.
the tv-506 came with the correct cable.

Tentec 1208 transverters also show up on ebay/qth,
but need 5w max drive (or 10w with resistor change).
Tentec is taking orders but are not shipping per their website.

Topic: 9154 Message: 9165

Hi Frank,

I have a lot of experience with VHF & UHF, since I do a fair amount of weak signal work (SSB & CW) from 6 through 432. Yeah your RF field stregth wqith the magmount next to the HF antenna is quite high. BUT don't forget, you're dealing with harmonics reaching 2m (I assume you're on 2m with your handheld), from at the closest, 10m. That's about the 6th harmonic, and it's going to be down at least 40dB. BUT, handhelds do have wimpy filters in them, and you may still end up with at the very least, overload & serious desense from either the harmonics, or intermod. If you're running serious power, yes, there may be a small chance of frying the front end of the HT.

You might want to do, what many of us who contest on HF and above do when multiple radios are running, with antennas close to each other (because oftentime the rigs being used in a multi-op will overload each other's receiver front ends), either install a 2m bandpass filter in the feedline to the HT, or else build a stub trap for 2m, that will also act a as a bandpass filter, and put it in the feeline path. One of these two items (which are pretty similar, but are just built differently), should do the trick.

73,
Ellen - AF9J

9166. Re: [TS-520_820_530_830] RigBlaster CW Keying Circuit

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-30 00:34:50 UTC
From: Tibor (Tibi) Zentai
Topic: 9153 Message: 9166

Hello Max,

Data sheet states:

DETECTOR
Breakdown Voltage
Collector to Emitter IC = 1.0 mA, IF = 0 BVCEO All 70 100

Tipical 70V breakdown Voltage is low for keying -65V. General principle that it should be min. 150-200V or better.

The case is very simple: you can use this transistor to agitate a relay using 5-12V DC. This relay may be a DIL IC reed relay thah is a very common component and the price must be a few bucks over there . Relay needs one closing switch and nothing more.

Advantage: no galvanic coupling between trx and other electronics.

Circuit: the emitter is on common ground, base stays open, and to collector you connect one end of the the coil of relay. The other end is connected to DC (5-12V) according to the relay type you get. The closig contact is connected to the radio CW jack with shielded cable.

That's all. My CW control goes directly from the serial port of the computer with a one transistor "interface" and combined with the elkey. The relay is in my elkey.

I received the following today, and have
his permission to post it here in the
group:

Hi Ken,

Just saw your ad where you were looking
for a VFO-230. I have one in perfect
shape for sale for $200.00.

I do not have the box and the cable,
but only a copy of the documentation.

I also have a VFO-240, and a
TS830-S with CW filter for sale.

If interested, contact me.

Very 73,

Wayne N5BV

If you are checking the 12.6 tube filament voltage, be sure the voltmeter is on AC volts.

I remember the same post as well, I think one of my questions
initiated it. If I remember correctly the company had 10 and 14 pin
connectors but did not advertise a 12. I know the connectors were a
JTA (Japanese Telecom Authority)standard back in the '70s, and were
probably easy to get. Ah well, I'll go with a more modern connector,
after all a round hole is easier to cut in the back panel than a
square one. :)

9172. Transverter Connector for 520 Series

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-30 05:04:04 UTC
From: baumbrent
Topic: 9172 Message: 9172

According to my search of the web tonight there is a US based source for the elusive 12 pin connector used on the TS-520 and 520S as the transverter connector. Also known as a Hirose or Sumicon 1600 series connector pictures, measurements, etc. can be found at www.hirose-connectors.com/products/1600_1.htm and at hirose.co.jp/cataloge_hp/e21600015.pdf.

The US company that apparently carries them is Intercon 1, 1750 Goedderz Rd., Suite C, Baxter, MN 56425, (218) 828-3157. They don't show a web site.

I also mis-spoke in an earlier post, the Japanese telephone company is NTT, not JAT or JTA, blame it on a faulty memory.

Good luck to all you who are trying to build transverter cables.

Hi can anyone tell me if they have used an Astatic D-104 mic with the built in amp on a 830.
I use an MC-50 with favourable reports but wondered if the D-104 would introduce more bass frequencies.
Any constructive comments would be gratefully received.

Regards Kevin.

Kevin:
The MC-50 is pretty flat. The D-104 has more highs. I have an article about improving the response of the D-104 posted in the files section of both the KenwoodMics and the astaticmicrophones Yahoo Groups.

The TS-830 rolls off at 400 Hz because of the filter. So it is not going to have booming bass.

If you want to get bass try an old turner m3+ or a M2. You will not get much below the lower skirt of the filters in the Kenwood.

And if you have the bucks a Sennheiser MD421 mike would be great.

Looking for help on a couple of things....

According to the meter on my AT230 I'm only getting about 85-90 watts out of my 830. I've swapped out the driver tube with a couple of spares I have and get the same results. I have a matched pair of extra 6146W's in the drawer I could try but am wondering...could the meter on the AT230 be off that much? I don't have anything to calibrate it against. Is there a certain plate current reading I should be achieving for a given power output? I can easily get 60 mA idling current, and my HV is good.

Following the last few threads on bassy audio....

I did a direct balanced modulator feed into the 830 by feeding the audio directly into C113(+). This cap is on the output of the final mic amplifier stage just before the modulator. To this I fed my Behringer mic which goes through a W2IHY EQ. With this setup I get nowhere near the average PEP output like I do when using the MC-50 into the mic plug. I know it isn't the modulator feed because I have also fed the W2IHY into the mic plug and get the same results. I will get 90W on a whistle, but the average barely goes over 50W. I have also swapped out the 2.4 Khz filter for a 3.0 Khz filter from a 930. Could there be an impedance mismatch? This combination worked great feeding my TS850. I did the modulator and filter mod in hopes of using the EQ for some nice tailored audio but with such a reduction in output power I'm scratching my head.

Suggestions on both issues would be appreciated.

Max

9183. Cable connector from VFO-520 to TS-520

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-08-31 16:57:11 UTC
From: Bill
Topic: 9183 Message: 9183

Maybe just maybe I will get lucky and find this cable that someone has laying around. Without it I am dead in the water. No TX or Rec. Any help would be most appreciated. You might even know where i can order one.
Item 2 My rig is missing the Jumper plug. I have tried several places with no luck.
Any help would sure be appreciated.

To ge the radio going all you need is a jumper. Look at the back of
the radio. Clockwise from the gap jumper the first 2 holes. The radio
will work. You will probably have to make up the cable. The plugs P/N
from Kenwood is E05-0901-05. They are wired 1-1 with one shielded wire.

I just checked Kenwood parts and the plugs are discontinued.

I predict a flood of responses on this one.

You may already know that the jumper plug isn't required. A paperclip cut and bent to fit between the 2 pins is sufficient. Just make sure it fits very snugly.

As for the cable: I am using a chunk of 4 pair computer LAN cable. I cut the heads of some brass brads of the right diameter, soldered these to the cable ends, put on a little shrink wrap for luck and then just stuck them into the holes in the VFO sockets. For a while I just stuck the ends of the wires in there but they kept coming loose. The connection is direct pin-to-pin, e.g. pin 1 on the radio goes to pin 1 on the VFO, etc. I guess I could get fancier, but it works great.

Good luck and have fun,
Brent K7MEI

Looking for help on a couple of things....

According to the meter on my AT230 I'm only getting about 85-90 watts out of my 830. I've swapped out the driver tube with a couple of spares I have and get the same results. I have a matched pair of extra 6146W's in the drawer I could try but am wondering...could the meter on the AT230 be off that much? I don't have anything to calibrate it against. Is there a certain plate current reading I should be achieving for a given power output? I can easily get 60 mA idling current, and my HV is good.

Following the last few threads on bassy audio....

I did a direct balanced modulator feed into the 830 by feeding the audio directly into C113(+). This cap is on the output of the final mic amplifier stage just before the modulator. To this I fed my Behringer mic which goes through a W2IHY EQ. With this setup I get nowhere near the average PEP output like I do when using the MC-50 into the mic plug. I know it isn't the modulator feed because I have also fed the W2IHY into the mic plug and get the same results. I will get 90W on a whistle, but the average barely goes over 50W. I have also swapped out the 2.4 Khz filter for a 3.0 Khz filter from a 930. Could there be an impedance mismatch? This combination worked great feeding my TS850. If you are talking about the 9 pin VFO socket, Get a standard size paper clip. It will be the same size diameter as the pins on the VFO dummy plug. Bend it into a u shape that is wide enough to span pins 8 and 9 on the VFO plug. Cut the legs to about 3/8 inch. Push it into the VFO plug pins 8 and 9 so it interconnects them. Pin 9 is the last pin counterclockwise or the pin just to the left of the gap. This is looking at the plug from the rear of the rig. Pin 8 is the next one to the left of 9. I got two 820s rigs at a sale for $90.00 for both because everybody thought that they were broken.

Latest update.I think everything is on track,somewhat.I got this radio nearly free and I think it was put together from parts.Nothing seems to adjusted right on but maybe close.I start my last atempt by aligning the boards as per user manual and on 20meters I am able to get 100watts or more,sometimes fluttering back and forth to 200watts so I'm thinking it just needs to be aligned but many tuning slugs are cracked and I can't adjust them. So 20 meters is all I have to verify that it is putting out RF.Last problem,In fixing the power supply boards I must have knocked something loose because now my ALC meter is not reading anything and I don't see anything obvious,where does the ALC meter get its reading from where does it go through?
Thanks
Jon

Any secrets to neutralizing a 520S. Have tried on both 10& 15 m w/ good pair of RCA 6146A's and a new pair of GE 6146A's. Same results whether I listed to a nearby RX or measure RF output w/ RF probe & VTVM - SG switch OFF. I can get close on 15 but then 10 is off. Then again it may not be possible to achieve great neutralization!

Thanks

Neutralization should be performed on the highest frequency. It's
purpose is to prevent a linear amplifier (which your final stage
is) from breaking into oscillation due to feedback between input
and output through the interelectrode capacitance. If the
neutralization is performed at the highest frequency, the feedback
will be good for all lower bands.

Yes,
40m,
Using a 300W dummy load
240 mA
780V
not sure of the line voltage

May have been my tune up procedure, seems to be a little more than 100W now. Still curious about the adjustment for bringing up the low end and why I can't get more power using the W2IHY EQ combo.

Hi Max,

Here's something else to add to the equation. It sounds like you're aobserving the 85-90 watts out, while operating voice. I can remember way back in the 80s, reading questions & comments in QST & CQ magazine about this very same issue. Here is the gist of the responses to this question:

If it's occurring on CW keydown, then yes, you are a little down on power. If you're seeing this on voice, don't worry about it, the majority of power meters do not have fast enough response timewise, to catch power peaks, during voice operations. The transient time is too short, for the meters to react in time. One response to this power question I read (I think it was in QST in 1986 or 87) went so far as to say that with the (relatively) slow response time of power meters, the meter reading should only peak out at maybe 1/3 of your maximum (available) power output, during SSB operation. If it's over this, then you're probably overdriving your finals (can you say splatter & spurs? - I knew you could). Personally, I check maximum power capabilities with CW keydown. To check for maximum voice power, I use the ALC meter function on the rig. \

73,
Ellen - AF9J

The TS-520 should be netrulized at 28.5 Mhz. 10 A or B Band. Once done, on other frequencies it will not be as well netrulized. This is normal for Multi-band rigs and causes no problem.

This must be done with the final unit cover on.

Subject: [TS-520_820_530_830] TS-520 Neutalizing

Any secrets to neutralizing a 520S. Have tried on both 10& 15 m w/ good pair of RCA 6146A's and a new pair of GE 6146A's. Same results whether I listed to a nearby RX or measure RF output w/ RF probe & VTVM - SG switch OFF. I can get close on 15 but then 10 is off. Then again it may not be possible to achieve great neutralization!

Thanks

Joe k7mks

Hi Max and All,

Adjusting your carrier set points will not neccesarily drop your audio response curve. The coupling caps and bypass caps need to be changed out as the radio might not pass <350hz. or > 2600hz regardless of your carrier set points. I did mine a while ago and documented everything if I can find the notebook. Take a look at a program called HamAlyzer. There is a 30 day trial period for you to play with it. You plug your audio into your sound card input and it works as a spectrum analyzer. You can use it to sweep your TX and RX audio I used the 830S' calibrate signal to plot my filter passband and put the jpeg in my photos section. I have 2.4khz filters in both I.F.'s. You can inject tones into your mic input (transmitting to a dummy load , please) and pull your audio out your monitor function for TX curves.
You will get better results if you pull WWV's 500 or 600 hz calibrate tones and use HamAlyzer to set your carrier oscillators. You can get within 1 or 2 hz so your radio is on frequency then play with the coupling caps for frequency response. Be very careful with the product detector coupling caps. If you use too large a value of capacitor, your audio response will widen but you will get head rattling pops on CW with headphones on.

That's why you go out to the 28.5. Some times neutralization can be more difficult than others. This is especially true if you don't have a matched pair. It doesn't mean you can't use tubes that are not a matched pair, it just means they can be a little more difficult to neutralize. For the process some people just go the route of spending a little more on matched pairs for ease of neutralizing or they just don't know the truth about matching v.s. not.

n9wb <n9wb@...> wrote:
The TS-520 should be netrulized at 28.5 Mhz. 10 A or B Band. Once done, on other frequencies it will not be as well netrulized. This is normal for Multi-band rigs and causes no problem.

This must be done with the final unit cover on.

Joe one other thing that helps, is to try to use the same kind of tube your radio came with. For example: both my TS-830S radios came with 6146B's. sometimes the radios work better with the same kind of tubes in them. I've tried W's for running my linear and they gave me no problem, but others have said they don't work as well in thier radios. for what it's worth. Passing on what I've encountered.

Ellen, this stub trap is new to me. Where is the stub trap placed? I'm getting ready to place 2 back in the shack.

Ellen R <ellenjoanne2003@...> wrote: Hi Frank,

I have a lot of experience with VHF & UHF, since I do a fair amount of weak signal work (SSB & CW) from 6 through 432. Yeah your RF field stregth wqith the magmount next to the HF antenna is quite high. BUT don't forget, you're dealing with harmonics reaching 2m (I assume you're on 2m with your handheld), from at the closest, 10m. That's about the 6th harmonic, and it's going to be down at least 40dB. BUT, handhelds do have wimpy filters in them, and you may still end up with at the very least, overload & serious desense from either the harmonics, or intermod. If you're running serious power, yes, there may be a small chance of frying the front end of the HT.

You might want to do, what many of us who contest on HF and above do when multiple radios are running, with antennas close to each other (because oftentime the rigs being used in a multi-op will overload each other's receiver front ends), either install a 2m bandpass filter in the feedline to the HT, or else build a stub trap for 2m, that will also act a as a bandpass filter, and put it in the feeline path. One of these two items (which are pretty similar, but are just built differently), should do the trick.

73,
Ellen - AF9J

HI John,

Actually I misnamed them,they are called Coaxial Stub filters.
Here's a couple of URLs for info, and for building them:

http://64.233.167.104/search?
q=cache:3QfAUBETq1EJ:www.radagast.org/~dplatt/hamradio/K6OIK-
filters.pdf+stub+trap+filters&hl=en&gl=us&ct=clnk&cd=1

http://www.bigskyspaces.com/w7gj/filters.htm

At the second URL (which does a decent job of explaining Coaxial Stub
Filters), go down the page to where it says "STUBS", for the
explanation on them, and where to get addtional info on building
them. They're pretty cheap to build. When I was more into
contesting than I am nowadays, I used to to get NCJ. It had an
article on building them. Multi-op contest stations run into your
problem all of the time, and this is one of the ways they deal with
it.

Well, back to work for me,
Ellen - AF9J

Ok,

I have an Ebay 520S and a D-104 mic (nonamplified). Everything seems to be fine with each unit. I cannot get them to work together.

I tune up the 520s by the book. Keying the mic keys the transmitter, but it seems to lock up the transmitter, also. I unplug the mic and it frees the transmitter.

What am i doing wrong?

Paul

Paul, you may have a wire whisker on a cable inside the mike someplace that is touching and keeping it keyed. The problem is in your mike cord or keying circuit. If the mike base had a push or mash to talk switch, it may be sticking.

Sounds like your VOX delay is toolong, holding the transmitter on
transmit. Check your VOX settings, or turn the VOX off and see how
the mike works.

You may also want to isolate the problem by borrowing another mic
and then see if the radio still locks up in transmit. If your VOX is
off and it still locks up then we need to look at other things like
a sticky T/R relay. Also check the locking clip that holds down the
PTT bar on the side of the stalk. Is it pinching the PTT bar and
holding it in the ON position?
Good luck. My 520SE with the D-104 gets consistently good audio
reports, and I think you will enjoy yours once the kinks are worked
out.

Take an ohmmeter and put it across the contacts
in the connector at the end of the cable. Close
and open the switch to see if it makes any difference.
Are the Astatics the ones with the sliding holddown
clamp? If so, slide it back down (up? I forget) and see if that makes
a difference.

Just another opinion.

Ken, W8ASA

Hi Max and All,

Adjusting your carrier set points will not neccesarily drop your audio response curve. The coupling caps and bypass caps need to be changed out as the radio might not pass <350hz. or > 2600hz regardless of your carrier set points. I did mine a while ago and documented everything if I can find the notebook. Take a look at a program called HamAlyzer. There is a 30 day trial period for you to play with it. You plug your audio into your sound card input and it works as a spectrum analyzer. You can use it to sweep your TX and RX audio I used the 830S' calibrate signal to plot my filter passband and put the jpeg in my photos section. I have 2.4khz filters in both I.F.'s. You can inject tones into your mic input (transmitting to a dummy load , please) and pull your audio out your monitor function for TX curves.
You will get better results if you pull WWV's 500 or 600 hz calibrate tones and use HamAlyzer to set your carrier oscillators. You can get within 1 or 2 hz so your radio is on frequency then play with the coupling caps for frequency response. Be very careful with the product detector coupling caps. If you use too large a value of capacitor, your audio response will widen but you will get head rattling pops on CW with headphones on.

Paul:

First, check to be sure that the vox is off as Gordon suggested. If it still locks up check the plug wiring.

Assuming that you have the original 4 wire cord on this mike base, be sure that your plug is wired as follows:
1. White (mike audio)
2. Red (PTT)
3. Black (switching ground)
4. Shield (audio ground)
If there is a switch, place it on R.

If this does not make sense or if you have a 6 wire cord, write me back and give me more information about your stand.

Ok,

I have an Ebay 520S and a D-104 mic (nonamplified). Everything seems to be fine with each unit. I cannot get them to work together.

I tune up the 520s by the book. Keying the mic keys the transmitter, but it seems to lock up the transmitter, also. I unplug the mic and it frees the transmitter.

What am i doing wrong?

Paul

Paul:

I had the same problem with my 520 while hooking up my trusty old turner mic.

What I discovered was that the PTT keying lines must be seperate. Many mics inside the mic tie one side of the PTT to ground which is what my turner did. This caused the 520 to key up even when the mic PTT was not pressed. I had to take the two ptt lines and connect them to the switch inside the mic removing the connection to ground on one of the lines.

Use a meter and see if the mic ground and one of the ptt wires are connected. If so remove that connection in the mic and all should be well.

I have not looked at the schematic to see why the 520 behaves this way but it does.

Good Luck

too much RF in the shack ? check grounding.

baumbrent <brentbaum5323@...> wrote: You may also want to isolate the problem by borrowing another mic
and then see if the radio still locks up in transmit. If your VOX is
off and it still locks up then we need to look at other things like
a sticky T/R relay. Also check the locking clip that holds down the
PTT bar on the side of the stalk. Is it pinching the PTT bar and
holding it in the ON position?
Good luck. My 520SE with the D-104 gets consistently good audio
reports, and I think you will enjoy yours once the kinks are worked
out.

9218. TS-820 IF board

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-09-02 16:20:51 UTC
From: w5rkl
Topic: 9218 Message: 9218

Morning everyone,

I'm looking for a good, working, TS-820(S) IF board (X48-1150-00). I'm not concerned whether the filters are attached. The IF board is located on the left side of the 820. The top and bottom covers will have to be removed. There are a series of plugs located under the chassis that need to be pulled and 3 mounting screws located on the left side of the 820 must also be removed. Care should be taken to ensure none of the potentiometers located on the edge of the board are not damaged or turned. Include the angle mounted bracket with the board please.

If your board doesn't have the filters, that's fine, I have 2 working filters that I can transfer from my IF board to the new board.

If you have an old TS-820 with a known working IF board and would be willing to sell the IF board, please let me know. Include your price (including shipping to zip code 74953).

Thanks and 73's,

Mike

Bill,
Give us some details. What does it do when you try to Transmit ?
do you have Idle Bias of 60 ma? Do you show High Voltage? if so, What
is the reading?
Are the tube filaments lit ?
There are so many questions we need answeres for and then we can help
you figure it out.
Please pass along as much info as you can. There are many sharp minds
here to help you.

9225. transmit out of specs

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-09-03 00:35:42 UTC
From: Valued Customer
Topic: 9225 Message: 9225

Hello group!

The manual says the TS-520 will transmi in the 80M from 3.50 to 4.00. But the dial will spin well past 4.10. Does that mean I can transmit (ie MARS) above 4.0?

Will this radio transmit on any frequency it can receive? I don't see anything in the manual that says any range is 'blocked', but maybe I'm missing something, likely in my head.

Thanks again!

73, Frank K2NCC

9226. TS830S ALC Meter

From: Ruben Echevarria
Topic: 9226 Message: 9226

Any thoughts as to why when I switch to ALC on my TS830S the needle gets pinned to the right? Also have no RF output. SG witch checked. Finals and driver replaced. This is the number 1 TS830S that I sent out for repair and for some reason the gentlemen could not find the problem. But when I sent it to him there was no ALC indication on the meter at all. Now there is but it looks like it was wired to indicate some reading and I believe
that it's not a true reading. Basically I can't get any RF output although it recieves. Only piece of test equipment I have is a multimeter.

Ruben,
I had that same problem with the ALC pegging on an 830 about a year ago. At that time, I wasn't repiaring my own gear and I sent it out to be repired. Turned out there was an FET installed wrong (backwards) causing the ALC to peg. However, My 830 would still transmit just fine. You could always take the non working 830 and one by one swap the boards with your working 830 to isolate which board is causing your problems. Have you checked the Relay ? Bad contacts could cause your condition.
My latest 830 is almost ready. I replaced the bandswitch couplers and all that works great now. The couplers that K4EAA sells are very nice and easy to install.
I just have to do a little more cleaning of the 12 meter contacts on the Band switch, and I'll sell her in search for another that needs help.. hi hi..

Hi Frank,
Not sure about the 520 as I recently sold mine, but I do know my
TS-850S/AT will transmit way out of each end of every Band.
It goes about 100 to 500 kc each way on every band before it will not
transmit any longer. For example, on 20 meters, it will trasmit
anywhere from 13.500 to 14.500. Although, I am wise enough to stay
inside the Amateur Bands !
So I would say, Yes, I am sure your 520 will also trasmit anywhere the
VFO will go.

Gordon, what do you use for a contact cleaner in the bandswitch. Only thing I have access to locally is some oily tuner cleaner at Radio Shack, so I'll have to order something. I have this super nice 530s that I think it would be a good idea to spray the bandswitch parts, then I'll be complete. I replaced the nylon coupler with K4EAA's brass coupler, easy to put in, mine both slid out the final cage out the front. Plenty of room to get the old nylon one out too.

You might want to check your RF Gain control. If it's
even partially turned counterclockwise it may run up
the ALC meter.

Hi Max and All,

Adjusting your carrier set points will not neccesarily drop your audio response curve. The coupling caps and bypass caps need to be changed out as the radio might not pass <350hz. or > 2600hz regardless of your carrier set points. I did mine a while ago and documented everything if I can find the notebook. Take a look at a program called HamAlyzer. There is a 30 day trial period for you to play with it. You plug your audio into your sound card input and it works as a spectrum analyzer. You can use it to sweep your TX and RX audio I used the 830S' calibrate signal to plot my filter passband and put the jpeg in my photos section. I have 2.4khz filters in both I.F.'s. You can inject tones into your mic input (transmitting to a dummy load , please) and pull your audio out your monitor function for TX curves.
You will get better results if you pull WWV's 500 or 600 hz calibrate tones and use HamAlyzer to set your carrier oscillators. You can get within 1 or 2 hz so your radio is on frequency then play with the coupling caps for frequency response. Be very careful with the product detector coupling caps. If you use too large a value of capacitor, your audio response will widen but you will get head rattling pops on CW with headphones on.

The 820 transmits a wee bit out of 'range' but of course one must not abuse as it's against regs. Worked a German station on 80m and swear to God (in Valhalla) he was just on the edge of the band. To zero beat him in I was on top of him. I suppose only Bush and Cheney can break regulations of any sort with impunity, but that's another story. Tnx for the xtal suggestion now running XTAL fix fq and it's great. Must fix the Heath keyer grounding problem and will be set for a Fall of CW mirth.

Topic: 9183 Message: 9235

Be sure that the switches on the back are in the correct position.
Some models may not have the transverter switch and the receive antenna switch

1. SG switch on.
2 Transverter switch off.
3 Receive antenna switch off

Be sure heater switch is on. Be sure that the carrier control is fully up.
Do not have a key in key jack or key must be closed.
Will only put out a carrier on Tune or CW.

Hi John,

I'm not 100% sure, but I think they're placed close to to your radio (the the one link I gave you, thae ham states that he put it after his linear). From what I remember reading in NCJ years ago, I think those were after the radios, in the feedline. They were pretty close to the radios too.

Hi Frank,

Yes it will. The only reason today's rigs won't transmit out of band, is because the microprocessors in them block any out-of band transmission from occurring (but even this is not a given - I had an early model SGC SG-2020, that had not only general coverage receive, it also had general coverage transmit! [I found this out on the late 90s, when I accidentally transmitted on 7302 KHz; hooking up a dummy load, I keyed up and transmitted well past 8000 KHz {when I finally gave up}]). But efficiency will start to drop, as you get further out of range of the tuned circuits that are used for each band in the radio, and as a result, output power will drop, and receive capability/signal strength, will also drop. Most of these Kenwood hybrids will work the MARS freqs. that are reasonably close to the ham bands, without much, if any modification.

From: mikefr24
Topic: 9239 Message: 9239

I seem to have the rig all working good (90-115 Watts) on all bands except for 10m which I can only get 10 Watts. I swapped the 12BY7 with a few different 12BY7A tubes and still get the same results so I put the original 12BY7 back in. I did notice that when I switch the band to 28.5Mhz or higher, the frequency stability goes nuts. It will jump on the digital display all over the band +-.300Mhz on recieve. Transmit makes no difference. Maybe there is something dirty somewhere? It is rock solid on 21Mhz and lower. I have neutralized the finals and everything seems good in the final unit.

Hi Mike,

It sounds like the coils for 10m are out of whack, or even worse, one of them may be cracked. You might want to do the coil adjustment procedure outlined in the manual. If that doesn't help, then you may have a damged coil. The fact that you're getting a big freq. variation on 10m, seems to indicate the inductance in the coil for 10m is not holding steady. So it's oscillating all over the place. If the inductance isn't holding steady, the coil and/or coil form could be damaged. This can happen if somebody tried in the past to adjust one of the coils, the coil slug was stuck,and they wound up cracking the coil, trying to force the slug free.

9243. Re: TS-820S no transmit on 10m

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-09-04 01:28:39 UTC
From: w5rkl
Topic: 9239 Message: 9243

The instability on 10 meters is not caused by the final or neutralization. The instability more than likely is caused by dirty contacts within the RLL UNIT and possibly the VFO variable capacitor tension spring. Cleaning the VFO tension spring contact requires removing the side panel on the VFO case and spray contact cleaner on the tension spring where it contacts the VFO variable capacitor then turning the VFO through it travel, both ways, a couple of times. You might have to do this twice.

You might also consider removing the RLL UNIT and both circuit boards. The interconnection between the two boards is through a series of vertical straight pins. The connections at these pins may be dirty.

Hetrodyne oscillator band changing is accomplished by diode switching within the PD UNIT. I recently had a similiar problem with my 820 but it was on all bands. Removing the boards and cleaning the pins helped eliminate this problem. However, it may be a sign of other problems lurking in the RLL UNIT as a whole.

The RLL UNIT consist of 2 circuit boards (UNITS) that control the initial hetrodyne oscillator and VCO freqencies the 820 and/or 820S operates on. There are other circuits that mix, both transmit and receive frequencies such as the VFO (5.5 to 5 MHz) and IF frequency (8.830 KHz). However, IF there are problems in the PD and VCO circuits, you can experience instability or complete lost of transmit and/or receive.

By the way, the 820 and 820S are the same radio except the 820S has the digital display and support circuitry. Pulling the digital circuitry from an 820S makes it a plan 820. Therefore, a board or UNIT, as Kenwood calls them, in an 820 will also work in an 820S and vice versa.

Having said all of this, since you have stability on 160 through 15 meters, I would suspect the instability is a dirty contact, possibly in the RLL UNIT.

Care must be taken if you remove the PD and VCO boards; they are both mounted in the RLL box, the PD UNIT board is the bottom board.

If you are going to remove the RLL UNIT, carefully remove the 5 plugs on the front side of the RLL UNIT FIRST. I do not recommend removing any screws that hold the circuit boards to the box UNTIL the RLL unit has been completely removed. Unfortunately, the wiring harness hides 2 of the 4 screws that hold the RLL UNIT box to the chassis. I had to remove the AVR board, located to the right of the RLL UNIT box, which gave me access to the 2 screws. Again, care must be taken when

removing the plugs. DO NOT pull the plugs out by the wires, use a small needle nose pliers and gentle pull the plastic plug straight until it's removed. Again, be careful to not break the plug and any wires coming from the plug. Reinstallation is simple reversing the process. When cleaning the pins I used a small wire brush and cleaning solvent and gentle cleaned them. The pin blocks will come out so do not loose the plastic insert for each pin block. Take note how the pins are held in the RLL box. The circuit boards only connect to the pins one way so take note of this before removing either of the boards. Removing the PD and VCO boards is somewhat difficult so be carefull not to break the boards. Bending could cause a circuit board trace to crack so don't bend them. I pulled them out using a small needle nose pliers and the pin block female connector, very gentle until the board came out. Reinstalling the board, push gentle on the pin sockets ONLY, not on the board.

Good luck.

The remote VFO has nothing to do with any of the switches you listed.
It is merely a "REMOTE VFO". It is not a transverter.

To use the VFO520 plug it in and use the switch on it to select the
method of operation, remote, split, or main.

No other changes need to be made.

Ace Hardware carries a product called Blue Shower. It is a completely dry wash. CRC makes a product called No Flash. I have seen it at Electrical supply stores. I have used rubbing alcohol in a pinch but the Blue Shower or No Flash works better. Remember that alcohol is a conductor so it should be used with the power off and allowed to dry before applying power. Do not use other alcohol as they will quickly dissolve plastics.

Building supply stores such as Lowes and Menards might have one of the above.

Craig De-Oxit is the preferred product, however.

Mikes:
I would like to add:
This is the box that contains the PD and VCO boards on the bottom side. When you have these boards out, look the solder side over closely with a magnifying glass. Some connections, often have cracked solder connections. This is a sometimes a circular crack around a component lead that is easier to see with a magnifying glass. Resolder any of these that look cracked with a small low wattage soldering iron. Check around connector pins. A couple of production runs of these boards seems to have this problem more than others. If you are very careful it is easy to fix. Just be very careful and take your time.

Be very, very careful not to get any solder bridges where you solder. Check each place that you solder with a magnifying glass for bridges. If you accidentally do get one, remove it before you move on. Solder bridges are very hard to find later and can cause multiple problems including component damage when powered back up. I always do this in a quiet environment with no distractions. If the kids are fighting at your feet, and the cat is climbing up your back, it is easy to get a solder bridge and miss it. Solder bridges can turn a small problem into a big one and sometimes turn a good radio into a parts radio.

On one of these boards, I believe the PLL board there is a slide switch. It says Tun/Nor. Clean this switch. Then be sure it is returned to the Nor position. After replacing the boards, double check this switch and be sure it is fully in the Nor position.

Hi Mike,
Is it:
just the display that's jumping around and the radio is stable
or
the whole thing?

There is a conspiracy happening here. Two nites ago my 820s was fine.
Had a QSO with Norfolk Island. Yesterday morning the digital display
was running amok - about 300khz on 20M but the Rx and TX were stable.
By noon yesterday the display was not even in the right band so opened
up the rig and cleaned all connectors, pots, and switches with de-oxit.
Wouldn't you know it, the display is now fine but I now have no TX or
RX. When I key up I have HV but the is no ALC or IP. There is no RX
audio unless Audio Gain is maxed out then there is just a faint hum in
the speaker. VFO 8-9 are shorted and SG is on.
Thank goodness it's a long weekend in Canada so I still have today to
try to solve this before it's back to work.
regards
Barry VA7GEM

There is no such thing as a "gold" edition. Some one years ago started
that nomenclature to squeak a few more bucks out of a sale and it caught
on. There were only two 830 models; TS-830S and TS-830M. The "M" had AM
capability and was not sold in the U. S. Gold, silver, bronze, red, blue,
yellow, etc. 830 labels are fully embedded in urban myth as to value
differences.

Dave,
I use ONLY the Caig DEOXIT D5 cleaner. It has never failed me yet. I found mine at the local electronics Store here in town. If I recall, it is about 15 bucks for a 5 oz can. I also have some sewing machine oil that I use to lube the fan motors and any bearings .
Those two items are a staple in my tool kit here.

73,
Gordon

I have this super nice 530s that I think it would be a good idea to spray the bandswitch parts, then I'll be complete. I replaced the nylon coupler with K4EAA's brass coupler, easy to put in, mine both slid out the final cage out the front. Plenty of room to get the old nylon one out too.

Mike,
Have you cleaned the bandswitch (including the part of it inside
the Final cage) ?
Be careful in the cage as there is Lethal Voltage in there. Be sure
the rig is off and the Plate voltage has bled down before playing
inside the cage.
Your problem sounds like a Dirty Band switch.

I just completed replacing the bandswitch coupler in the final compartment. Being as careful as I could be, darn if I didn't get it off when I reassembled it. It took some fiddling with to get it back right. So, be careful when taking that apart you get it back like it came part. I was either a quarter turn off or a half turn off two or three times. It takes some time to put it all back together, and put the final cage on there and power it up only to find its not right.

The fourth time I said "My oh my, I must take this apart again"......yeah right.

Good luck,
Dave W0DLR

Hello Mike,

I suffer from the same problem. I agree with Gordon i.e. bandswitch/coupler problem. I am going to do the actual half-year maintenance this week. Sometimes 12 m, somtimes 40 m fails, now 10 m said good bye.

On the other hand there may be some other problem (too) with you for the frequency deviation is not a usual symptom of bandswitch/coupler problem. It may be caused by an old solder on RF stage PCB. Do hope I am not right.

From: Bill Scurlock
Topic: 9263 Message: 9263

Dave,

For your reference, and maybe others on this reflector, I am going to copy into this email the info provided by Clif when I was struggling with how to align the bandswitch inside the final cage with the shaft thru the other sections of the bandswitch mounted on the RF Board. This does not address alignment of the switch sections on the RF Board - just the relationship between the shafts in each compartment. This was a tremendous timesaver and help to me, and maybe it will help others also - Thanks Clif.

73, Bill, K5GCW

To align the bandswitch sections;

Put the radio on 10Mhz. The flats on the shaft (on the RF Board) should be vertical. Check the shaft in the final compartment. There should be a flat to the outside (right side of radio viewed from front) and one to the bottom. This is the correct alignment.

Clif

Bill, thats what I thought I had accomplished, however, I kept getting it wrong. After some fiddling with it, I got it right. Now it works perfect, but I thought I was going to wear the allens out before I got it right. I don't know why I made that so difficult. Anyway, they still have the best sounding audio, transmit and receive of about anything I have owned.

Pay attention to Bill's instructions if you are working on that bandswitch coupler. It will save lot of time. I probably spent two or three hours on this 30 minute project.

Topic: 9252 Message: 9270

All 830S came with only the 2 SSB filters installed; all CW filters were optional. I have two product brochures; one showing the gold label and one showing the silver label. The specifications, default filters, optional filters, text, pictures, etc. are identical. If you have CW filters installed, most likely they were installed by the previous owner(s). This same information is also detailed in the only operating manual printed for the 830S, Part # B50-2738-00. The silver badge, Part # B43-0643-04, was quickly replaced by the gold badge, Part #B43-0656-04. All issues of the service manual only show the gold badge part number.

However, I one "believes" they have something "special" and they feel comfortable with it, that's fine with me. I don't really care. My issue is with sellers trying to squeeze a few more bucks out of sale on the pretext of it having a "gold" label. Obviously, if the rig has additional filters versus one that does not, there should be an incremental price difference regardless of what color(gold/silver/red/blue/green) label is on the rig.

Barry:
I kind of lost track of what happened here. The rig had no 10 meter transmit, you removed the PD and VCO board and fixed something that in the end restored 10 meters after you got the connectors back on right. Is that correct? If so What did you fix on the boards ?

Walt
This started with a rolling digital display. Opened all connectors
and used de oxit. Replaced connectors (in wrong places) and display
now stable but no ALC or Bias. WIth Gordon's help got the connectors
back on the correct pins and back to original problem. Next weekend
will remove control unit for a better look.
regards
Barry

Well thank you Ellen, I looked at it briefly. It seems that if it is placed right behind the radio it's not as effective as placed one quarter wave away. I didn't get to look that much in detail since I was trying to clean up the yard.
Ellen R <ellenjoanne2003@...> wrote:
Hi John,

I'm not 100% sure, but I think they're placed close to to your radio (the the one link I gave you, thae ham states that he put it after his linear). From what I remember reading in NCJ years ago, I think those were after the radios, in the feedline. They were pretty close to the radios too.

Very good explanation Peter, I tend to agree with your version. It probably was a marketing ploy of sorts. As for the ones I have, they were purchased used so I can't say that's how they came from the factory. Could be that the so called Gold versions were produced during some sort of anniversary year and they used the Gold badge to signify that. Other than that there are no differences in the rigs. In my opinion " MYTH BUSTED" .....Ruben KA2HHB

HI again John,

I forgot to mention that MFJ seels a bandpass filter for 2m, and PAR Elcetronics also sells them. This month's edition of QST briefly talks about these filters in the Q&A section.

Hi all,

Over the weekend I decided that I "needed" an 830s. Found one on an online auction site (can we say that here) and arranged for it to be shipped to me. I already know the rig is missing the side handle and don't know what else it needs and I figured this would be a good place to get a "handle" on replacement parts, alignment procedures, etc. Sorry for that bad pun, but I can't resist a pun.

Me: I'm 45, been a ham off & on for about 30 yrs. When I became active last fall after being QRT for 5 yrs, I bought a very nice 830s. SN in the 7nnnnnn range. It worked flawlessly and looked great. I used it for a bit and decided I really wanted something different so I sold in favor of a rig with QSK and a more contest-oriented RX with sharper filtering. Well, now I'm interested in having a back-up rig / 2nd receiver so I've come back around to the 830s. Part of me says I should have kept the other rig, but the one that's in the mail now has both CW filters. Assuming it works it may actually be a more capable rig than my 7nnnn rig was.

Very interesting ... given that the silver badge seems to have been replaced by the gold badge, I wonder if the mythological 'Gold Edition' is actually more common than the silver. In my experience, most of the 830s I see on eBay have the gold badge, and all of mine do.

If someone is ambitious, I wonder if we could use the group poll to figure out the population of gold vs. silver. I'm not sure if the polling function could sort it out.

If the silver is more rare, I think we should re-name it to 'Platnium Edition' and start charging higher prices for them ... :)

9279. 830 Platinum Edition For Sale

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-09-06 00:03:06 UTC
From: Ken Gunton
Topic: 9252 Message: 9279

FOR SALE: TS-830S Platinum Edition - RARE -

Don't settle for all that hype about the "Gold" edition! Be the first on your block to get this extremely rare PLATINUM EDITION transceiver, in perfect operating condition. 9.5/10 cosmetic.

ONLY $3,500.00, and if you buy TODAY, I'll throw in an SM-220, VFO-230, and SP-230, all of which are in nearly new condition.

You don't even have to pay shipping in the USA.

Never again will this special, one-of-a-kind deal be offered!

Careful Ken,
If I were to buy it and chemical analysis shows that the platnium is actually Silver, you'll be in for a very heavy LawSuit for False advertising !
None of us would like that. tell you what tho, I'll offer you $ 35.00 bucks for the whole lot,and we'll call it even. what say ?
To sweeten the Pot, I'll even pay for Shipping :-)

FOR SALE: TS-830S Platinum Edition - RARE -

Don't settle for all that hype about the "Gold" edition! Be the first on your block to get this extremely rare PLATINUM EDITION transceiver, in perfect operating condition. 9.5/10 cosmetic.

ONLY $3,500.00, and if you buy TODAY, I'll throw in an SM-220, VFO-230, and SP-230, all of which are in nearly new condition.

You don't even have to pay shipping in the USA.

Never again will this special, one-of-a-kind deal be offered!

Very interesting ... given that the silver badge seems to have been replaced by the gold badge, I wonder if the mythological 'Gold Edition' is actually more common than the silver. In my experience, most of the 830s I see on eBay have the gold badge, and all of mine do.

If someone is ambitious, I wonder if we could use the group poll to figure out the population of gold vs. silver. I'm not sure if the polling function could sort it out.

If the silver is more rare, I think we should re-name it to 'Platnium Edition' and start charging higher prices for them ... :)

From: mikefr24
Topic: 9239 Message: 9284

Ok. I finally got to look at the radio a bit more today. 10m is defiantly the only problem. The frequency jumps around a lot on the digital display on receive only. It does not appear to actually change the radio's frequency but only what's displayed. I can lock onto a signal and hear it just fine, but the display goes whacko. When I transmit the display will go rock solid but I only can get 10-20 watts. I looked at the band switch but can't really tell anything until I take it out. Is there an easy way to get that out? or do I just have to start taking everything out? I noticed that there is a chain on it and the shaft goes into the finals area. I have never disassembled the band switch before.

This problem seems like dirty contacts somewhere but I am no expert on RF equipment.

9285. Re: [TS-520_820_530_830] Re: TS-820S no transmit on 10m

mikefr24, I wouldn't be too hasty to start taking things apart if you don't have too. Try some good tuner cleaner, the gang here tells me to use Deoxit. I havent had to do that to any I have worked on, but I wouldn't take off any more parts than necessary. I took my bandswitch apart, and thought I was Mr. Cool and would get it back exactly as it came out. After 3 or 4 tries I got it back right. 'Taint easy as I thought.

Spray the heck out of everything with cleaner and canned compressed air before you start tearing up would be my advice.

There are very knowledgable guys on here that I know can help you with this. I have read their replies and they are experienced in what they say and do.

Good luck, my 2cents worth.

Mike,
You do NOT need to take the Bandswitch apart to clean it.
Turn the radio OFF and allow time for the plate voltage to bleed down
on the finals. Then remove the Finals Cover.
Spray all the wafers for the bandswitch while rotating the bandswitch
all the way back and forth. Do this couple of times. Put the cover
back on the finals cage and fire up the Rig.
I think you may be surprised at the results.
Nothing Difficult here.
Let us know your results and we will continue from here if need be.

Gordon

Mike,
Be sure to spray ALL the bandswitch wafers, even the ones that are
NOT inside the Final Cage.. I forgot to mention that !

9289. The Gold TS-830 exposed and The Heil "Goldline" Name

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-09-06 08:20:12 UTC
From: n9wb
Topic: 9289 Message: 9289

RE TS-830 Gold Edition, the facts.

The Kenwood Gold TS 830 uses special beta components that will outlast standard 830s and incorporates a electron accelerator in the screen grid circuit that has several advantages.

It was coveted by DX'ers because their signals would arrive at the DX station slightly ahead of the others giving a decided advantage in pile ups.

Unfortunately, the ARRL threatened to pull all of Kenwood's advertising from QSTs if they did not cease manufacture immediately. They considered this cheating in the contests and DX operations.

Kenwood complied and the Gold Kenwood was short lived. These rigs are rare because DX'ers who have them seldom sell them or let it be known that they own them for fear of government reprisal.

When they do end up on e-bay it is rumored that the government runs the biding up and snatches them up never to be seen again.

Bob Heil later coined the name Gold Line for one of his microphone lines and it is rumored that he incorporated a speech accelerator diaphragm comprised of accelloranium, an irradiated form of gold in some of his Gold Line elements, but Bob is very hush hush about this.

And Bob is seldom hush hush.

From: n9wb
Topic: 9226 Message: 9292

Ruben:
I was reading your posts on your TS-830 ALC meter pinning.
Is the following true:
1. The ALC meter pins only on transmit and then only when the meter switch is in the ALC position?
2. The radio receives?
3. The radio has no transmit?

Check all of the plugs to the boards, especially the IF, RF, and audio boards. Are they plugged in correctly. They can sometimes be plugged in with the wrong pins in the wrong holes and sometimes pins will get out of alignment and not go into the connector. Do the plugs appear to be in good shape?

You can leave the filaments off while performing the following tests. Do not leave the meter pinned very long.

Remove the 12BY7. Does the ALC meter still pin ? Leave it out for now.
If it stops pinning stop and tell us. If it still does turn the radio off , unplug it and proceed.

Carefully Remove connector 4 from the IF board. It may have ALM written next to a pin.

Fire the rig back up and see if the meter still pins. Unplug and turn off the radio.

If the meter still pins, stop here and tell us. If it stops pinning, proceed.

Replace connector 4 and remove connector 5. It may have a label ALC near it.

Does the meter pin now. This time, If it does not pin stop here and tell us.
If it does pin Proceed with the next step.

Take the meter out of the ALC position to save the meter. Turn the rig off, carefully replace connector 5. Turn the rig back on, place the rig back in transmit and measure the voltage on either side of VR-7.

Reply to the above and we will proceed to the next step.

Are you good enough with a soldering iron to remove and replace some parts from the IF board? This will probably require removal and replacement of the board a few times.

Subject: [TS-520_820_530_830] TS830S ALC Meter

Any thoughts as to why when I switch to ALC on my TS830S the needle gets pinned
to the right? Also have no RF output. SG witch checked. Finals and driver replaced.
This is the number 1 TS830S that I sent out for repair and for some reason the gentlemen
could not find the problem. But when I sent it to him there was no ALC indication on the
meter at all. Now there is but it looks like it was wired to indicate some reading and I believe
that it's not a true reading. Basically I can't get any RF output although it recieves.
Only piece of test equipment I have is a multimeter.

Yes Walt I've heard that story but was told never to speak of it...
Unidentified sources say that one of the components in the finals is called unobtanium
a byproduct of used inaquida taken from an extraterrestrial craft found in 1947 which
according to the same sources was part of an advanced communications system used
by the operators of that craft. Because of fear of reprisal I cannot disclose anymore.

Yeah, I seen those passing thru the AES catalog looking for something else. I'll be looking into the QST here soon. I read it in sections. I haven't had the problem yet, I was just learning where to find this information for when it does occur. Then I can read and ask questions. Right now I'm still moving my VHF-FM 2-meter gear back to the shed from the bedroom. The antenna is up and the radio is mounted, now the power supplies and ampmust move.

Ellen R <ellenjoanne2003@...> wrote: HI again John,

I forgot to mention that MFJ seels a bandpass filter for 2m, and PAR
Elcetronics also sells them. This month's edition of QST briefly
talks about these filters in the Q&A section.

What kind of antenna are you using? If you measure the resistance between the center and outside of the coax, does it show a short?

9297. Re: [TS-520_820_530_830] TS830S ALC Meter

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-09-06 16:44:21 UTC
From: Ruben Echevarria
Topic: 9226 Message: 9297

OK Walt, here goes : I plugged the rig in fired it up ALC
was pinned to the right of the meter. I checked the AF/RF
gain knobs and the RF was set all the way up clockwise.
My mistake. My apologies to the person that I originally
sent it too. Checked the SG switch set it to on.
Got 60ma on the meter. .
Plugged in my MC50 mic, spoke into it, got plenty of swing
on modulation, pressed compressor and received a more
pronounced swing.
So speech compression seems to be fine.
Meter Mode : RF Mode switch : in CW mode
Now I'll start a full check on each band starting with 10 meters.
10 Meters: 28.375 approx 10 watts rf out - meter pins to right
12 Meters: 24.960 approx 19 watts rf out – meter pins to right
15 Meters: 21.350 approx 35 watts rf out – meter pins to right
17 Meters: 18.130 approx 35 watts rf out – meter pins to right
20 Meters: 14.300 approx 35 watts rf out – meter pins to right
30 Meters: 10.125 approx 35 watts rf out - meter pins to right
40 Meters: 7.260 approx 28 watts rf out – meter pins to right
80 Meters: 3.860 approx 20 watts rf out – meter pins to right
160 Meters 1.830 approx 10 watts rf out – meter pins to right

Be advised ALC seems to be ok now. No longer pinning to right.
But when "METER" mode switch is set to "RF" the meter does
swing and pins to right side of meter.
Power output check was done with "MODE" switch in the "CW"
position.

The finals are fresh 6146W from RF Parts as well as the driver.
Receive seems to be fine. As loud and clear as my other TS830S
Platinum Edition (hi) ..

Well that's about it for now …Thanks for the help Walt

Subject: Re: [TS-520_820_530_830] TS830S ALC Meter

Ruben:
I was reading your posts on your TS-830 ALC meter pinning.
Is the following true:
1. The ALC meter pins only on transmit and then only when the meter switch is in the ALC position?
2. The radio receives?
3. The radio has no transmit?

Check all of the plugs to the boards, especially the IF, RF, and audio boards. Are they plugged in correctly. They can sometimes be plugged in with the wrong pins in the wrong holes and sometimes pins will get out of alignment and not go into the connector. Do the plugs appear to be in good shape?

You can leave the filaments off while performing the following tests. Do not leave the meter pinned very long.

Remove the 12BY7. Does the ALC meter still pin ? Leave it out for now.
If it stops pinning stop and tell us. If it still does turn the radio off , unplug it and proceed.

Carefully Remove connector 4 from the IF board. It may have ALM written next to a pin.

Fire the rig back up and see if the meter still pins. Unplug and turn off the radio.

If the meter still pins, stop here and tell us. If it stops pinning, proceed.

Replace connector 4 and remove connector 5. It may have a label ALC near it.

Does the meter pin now. This time, If it does not pin stop here and tell us.
If it does pin Proceed with the next step.

Take the meter out of the ALC position to save the meter. Turn the rig off, carefully replace connector 5. Turn the rig back on, place the rig back in transmit and measure the voltage on either side of VR-7.

Reply to the above and we will proceed to the next step.

Are you good enough with a soldering iron to remove and replace some parts from the IF board? This will probably require removal and replacement of the board a few times.

9298. RF Board Chain Link Drive

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-09-06 21:53:52 UTC
From: Bill Scurlock
Topic: 9298 Message: 9298

Question for the "Group"

The chain link drive furthest from the front panel on my TS-830S is very slightly loose compared to the other two chain link drives on this shaft. This makes it necessary to very gently wiggle the Drive Control knob to obtain a simultaneous "peak" on both Tx and Rx when tuning up. Visually you can see just a small amount of slack created on one side of this chain when the shaft is rotated. The other two chains do not show this much slack.

There appears to be a circular tension spring included in each chain drive. Does anyone have any experience in adjusting this spring to tighten the chain drive? Is there another adjustment to tighten these chain drives?

Thanks,

73, Bill, K5GCW

Subject: [TS-520_820_530_830] The Gold TS-830 exposed and The Heil "Goldline" Name

RE TS-830 Gold Edition, the facts.

The Kenwood Gold TS 830 uses special beta components that will outlast standard 830s and incorporates a electron accelerator in the screen grid circuit that has several advantages.

It was coveted by DX'ers because their signals would arrive at the DX station slightly ahead of the others giving a decided advantage in pile ups.

Unfortunately, the ARRL threatened to pull all of Kenwood's advertising from QSTs if they did not cease manufacture immediately. They considered this cheating in the contests and DX operations.

Kenwood complied and the Gold Kenwood was short lived. These rigs are rare because DX'ers who have them seldom sell them or let it be known that they own them for fear of government reprisal.

When they do end up on e-bay it is rumored that the government runs the biding up and snatches them up never to be seen again.

Bob Heil later coined the name Gold Line for one of his microphone lines and it is rumored that he incorporated a speech accelerator diaphragm comprised of accelloranium, an irradiated form of gold in some of his Gold Line elements, but Bob is very hush hush about this.

And Bob is seldom hush hush.

The nylon pedestal that the shaft rides on has it become elongated?
If so you may be able to create a shim and place it under or around the
shaft. It all depends on how much clearance there is. Get a telescoping
antenna, similar to one from an old transistor radio and with a tubing
cutter, cut maybe a 1/4 inch section and fit it to end of the shaft and onto
the pedestal. Or maybe somone in the group may have a replacement.

Hi Kieth,

The handle part you are searching for, I looked into for you. One source you may try is at Pacific Coast Parts.800-421-5080.
K01-0402-25 HANDLE CALL FOR PRICE
East Coast Transistor discontinued thier handle in stock, but was last priced at US $13.17.
You may also find responses from other people here in the group that may assist you.

Welcome to the group. I have two 830 radios myself along with MC-50 mic, the SP-230 matching speaker and SP-230 remote digital VFO with the 5 programmable memories.

You'll find others knowledgable on the topics of your questions here. Check out the archives too. Odds are somebody has had the very same problem before. There are repair people with shops here who do work as well. Many do thier own work as these radios are able to be worked on relatively easily, being of that era that they were designed and manufactured.

So get that Kenwood radio up and running. Come talk to us on the air. various members of the group are trying to get together and maybe get a Kenwood Hybrids Net together, which takes a little time and doing.

See you on the air.

"Darwin, Keith" <keith.darwin@...> wrote:
Hi all,

Over the weekend I decided that I "needed" an 830s. Found one on an online auction site (can we say that here) and arranged for it to be shipped to me. I already know the rig is missing the side handle and don't know what else it needs and I figured this would be a good place to get a "handle" on replacement parts, alignment procedures, etc. Sorry for that bad pun, but I can't resist a pun.

Me: I'm 45, been a ham off & on for about 30 yrs. When I became active last fall after being QRT for 5 yrs, I bought a very nice 830s. SN in the 7nnnnnn range. It worked flawlessly and looked great. I used it for a bit and decided I really wanted something different so I sold in favor of a rig with QSK and a more contest-oriented RX with sharper filtering. Well, now I'm interested in having a back-up rig / 2nd receiver so I've come back around to the 830s. Part of me says I should have kept the other rig, but the one that's in the mail now has both CW filters. Assuming it works it may actually be a more capable rig than my 7nnnn rig was.

Date: 2006-09-07 00:07:59 UTC
From: Bill Scurlock
Topic: 9303 Message: 9303

The SSB audio frequency response is not balanced between LSB and USB in my TS-830S. LSB sounds fairly decent, but USB has too much bass and not enough high frequencies. The Item 3 Carrier Adjustments have been set to spec., and the VBT Osc. has been set to 8375Kc per Item 5. I would like to check the Item 6 Carrier frequencies at 455Kc, but I can't figure out the drawing in the Service Manual that shows the "short jumper" near Connector 9 on the IF Board - so I don't understand where to connect the frequency counter. Can anyone clarify this for me?

Are there any adjustments other than TC2 and TC3 on the PLL Board that determine the USB and LSB transmit frequency response?

Any comments will be appreciated. Thanks.

9304. TS520SE

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-09-07 01:01:59 UTC
From: David Rust
Topic: 9304 Message: 9304

I just got a 520SE today via UPS from an Ebay seller.

I bought it knowing the receive was very weak and the transmit was not right.

I took both cases off and tightened each board to the chassis, and worked the bandswitch several times. Hooked the speaker back up, plugged it in and.....it worked like it probably did when it was new. The transmit didn't seem to come to life, but I didnt expect it to until I do some bandswitch spraying and cleaning.

So, not being an expert by no means, I would suggest to anyone to tighten all the boards and spray it all down before any repairs were started. Its amazing to me how these old radios work and work and work.....

I'll keep you all posted on the transmit situation.

Well Walt I removed the IF board completely, cleaned it then resoldered the pins on the front connector we spoke of. I also checked all the other solder joints with a magnifying glass, all looked good. I replaced the board fired up the rig and now my receive is right up there as compared to my other TS830S.
Still get get enough RF output. Only about 60 watts on 14.310.
I have a used set of 6146B and was thinking of doing a switch there. Although the W's that are in, are brand new and so is the driver.
Seems to me like we're making some headway.

Topic: 9154 Message: 9309

Walt,
Ellen had made reference to a quarter wave trap. I had not heard this technique prior and inquired as to details. She further corrected the term to phasing stub, a term I was familiar with. She further assisted me with reference to web pages for additional explanation. Also she had spoken of the articles in QST and some filters and who were the manufacturers.

I have not as of yet had this problem to contend with, however to hear of such a circumstance and how it is corrected is of interest to me. I learn who has this information and possible knowledge taht I may later refer back to for questions etc.

I am soon to reinstall my VHF-FM 2 meter gear back in the same station again. If such a condition occurs then it is easier to deal with that problem at that time. I have had my station put together before and no problems at previous QTH's but not here, especially with my Amplifiers. Then also it was 2 and 440 on handheld and couldn't run both from the same recepticle at the same time. Now I have expanded my station and conditions could change. Now I have linears on VHF and HF. I have slowly prepared this time planning carefully. I don't even have a TVI or RFI problem anywhere, not even in the shack since I took the end fed windom off the 830 and tuner.

When the topic arose, I stopped to obtain the references and basic info, and know where the rest could be found later.

As you know I'm running A full-size 40 meter quarter-wave with 1/2 inch hardline of 115 feet. I got the long wire out of the shack and life got better everywhere but on 160. Now I bring in 2 meters a little at a time and slowly add gear till I see a problem. Unlikely I will but just in case I know a little more to deal with it. The VHF gear is on a 1/4 wave vertical at 20 feet from ground just above the building that houses the HF station including the High Power Amplifier.

The only problem I'm having beyond the recieving noise which is typical of 40, 80 and 160, is getting enough power to run everything, including the computer.

So that's what that is about.

Subject: [TS-520_820_530_830] TS-830S Carrier Adjustment - Item 6

The SSB audio frequency response is not balanced between LSB and USB in my TS-830S. LSB sounds fairly decent, but USB has too much bass and not enough high frequencies. The Item 3 Carrier Adjustments have been set to spec., and the VBT Osc. has been set to 8375Kc per Item 5. I would like to check the Item 6 Carrier frequencies at 455Kc, but I can't figure out the drawing in the Service Manual that shows the "short jumper" near Connector 9 on the IF Board - so I don't understand where to connect the frequency counter. Can anyone clarify this for me?

Are there any adjustments other than TC2 and TC3 on the PLL Board that determine the USB and LSB transmit frequency response?

Any comments will be appreciated. Thanks.

I would carefully remove the spring, gently use a pair of pliers to compress it, then re-install it. I see no reason why that wouldn't work just fine.
Of course, Rubens idea would also work well.

The reason I asked what kind of antenna you used on two and 440 is that if it were a shunt fed antenna, one that showed a short between the center and outside of the coax connector, it would short out a lot of the H.F. signal.

John:
I will have to check the back posts to see what Ellen suggested, but a 1/4 wave piece of coax shorted at one end with a PL-259 on the other can be connected to a Tee connector at the back of your rig. On the frequency that it is a quarter wave, it will disappear, but on H.F., it will appear as almost a dead short. On 440 It will be 3/4 wavelength so I believe it would work there too. BTW, I assume that you know that a 1/4 wave series fed 2 meter antenna will double as a 3/4 wave 440 antenna.

Now, the next problem is the RF from the VHF or UHF amp getting into the H.F. system. If you are using a balun or a tuner with a balun or a tuner on H.F., I would not worry about it as it will block the uhf/vhf.

To make a quarter wave stub, make it's length 246/ F in MHz. Then multiply this by the velocity factor of the coax you will use. The velocity factor of most RG 58 U is .66. But if you want to you can look it up for the coax you are going to use. I usually use 13 inches for 2 meters measured from the edge where the center prong of the PL 259 comes out back to the end of the piece of coax. The end opposite the PL-259 must be shorted.

This method can also be used to DC ground an antenna to ground out DC from nearby lightning.

Hi John,

the optivisor has seven different lens plates that can
be changed out for the task at hand. Model DA-0 is just the
headband and no lens is included. Lens are precision glass.
you can flip up the lens hood when not needed and it can
be used with eyeglasses or safety glasses.

http://www.doneganoptical.com/optivisor.php (mfg link)

the lx model is similar to the original but uses platic lens

Actually, I'd be interested in a 3 KHz filter in the 830s which is why I checked out the ad.

What a poorly written ad. When people post something for sale you'd think they'd go to the effort of making sure things are spelled correctly, that abbreviations are minimized and that complete sentences are used.

Tnx for the heads up Max. At the least it has increased my knowledge which is a good thing!

How much power did you get from the Bs?

It looks like your High Voltage is low.

What high voltage do you get from the other 830? Is this one plugged in to exactly the same AC power source as the other one? No extension cords or anything different? The first thing to look for with low high voltage is the AC power source. Next would be the power supply caps in the voltage doubler. After that would be to check the diodes in the high voltage bridge circuit.
However, the diodes are easier to check.

I got a little better operating manual to the 830 and will soon have a better service manual.

Pete,

The information below is quoted from sources all over the internet. I bet if you were to look at the mic amp circuitry for the 530 and 830 they are probably the same. You could make the same changes. The part numbers might not be the same but if you trace through the schematics it shouldn't be a problem.

Max VE3TMT

Lack of crispness in transmit audio. Cause: The RF-bypass capacitor, at the collector of the 1st audio amplifier, is so large that it bypasses the higher audio frequencies along with the RF. {The amount of treble-rolloff in a stock radio is about 4.5db at 2800Hz.} Fix: On the IF Unit, at Q19, change C106 from .015µF to approx. 0.001µF. Q19 can be found directly behind the filter space for the larger of the two, optional CW-filters.

Hi Reuben,

I'm not sure if you are aware of this or not.So I'll say it in case you don't. 6146W tubes are a high dissipation tube. They produce less out put than a 6146B tube. I run 6146B tube is the original tube sold with an 830 radio when new. It generally works best with these radios since they were made around them.

Now a 6146W tube can be substituted in many times and are more readily available probably and the 6146B. The power output is less but is good for driving a linear. I use B's and drive a linear but I so often times right now especially, run barefoot.

That was just in case you didn't know.

Pete:
It is C-53 in the 530.

I agree with Max. In the 530, On the IF board kind of in the center there is a 7 pin connector. It is labeled 12 if the number is there. Next to it is Q11, R66, C 53 and C 54. Locate C-53, it is next to the round capacitor C-54. Remove C-53 a .015 uf capacitor and replace it with a .001 as Max suggested. This should make your audio more open sounding.

Thanks Max

9334. TS-830 audio distortion 21-28MHz

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-09-08 19:44:43 UTC
From: daveb0910
Topic: 9334 Message: 9334

Hello

I hope someone can give advice on a long-standing problem with my TS-830.

The problem is audio distortion only on 21, 24 and 28MHz. It sounds like RF feedback, but also occurs when I connect a dummy load so I guess isn't due to RF feedback from the antenna. The other symptom I have is low SSB power output on 24/28 MHz but I can still get 80-100W on CW on these bands. I seem to have to turn the mic gain up much higher on 24/28 and have difficulty in getting any ALC response. If I turn the mic gain down (no ALC reading, about 5-10W SSB peak output on my power meter) the audio distortion disappears and all seems well. So it seems to be related to either to power output or to the level of audio drive.

I have tried tweaking the RF coils on 21-28MHz, but no improvement was seen. Also, because I originally suspected that the problem was caused RF feedback from my antenna, I have tried all the grounding, ferrite filters on connecting cables etc, but this made no difference either. Over the last year I have also changed the 12BY6A driver tube.

I'm using an unmodified MC-50 mic (also have another MC-50 with a Heil HC-5 element, but this gives the same problem).

I've reached as far as I can go and would welcome any help or suggestions about what is causing this problem.

On the TS-830 it is C-106 on the IF board.
On the IF board there is a connector labeled 7. It is along side of CF 3. In that area you will find Q 19. C-106 is between Q 19 and the connector. It is a .015 uf.
Replace C-106 with a .001 capacitor. This should make the transmit audio more open sounding.

From: joe sloss
Topic: 9337 Message: 9337

When I applied power to my 830 the digital display illuminated briefly and then faded out. No "white" noise in earphones when AFG is full CW. S meter swings correctly with movement of RFG. No ALC reading in transmit. No transmit. No audio from crystal calibrator. I do have -6 VDC at Counter Unit Connector 2 Pin 12 and +12DVC at same connector Pin 1.

I suspect power supply problems somewhere but my Service Manual is hiding somewhere in the shack; I would appreciate comments until the manual shows up.

Thanks,

Joe k7mks

I was in the middle of tuning and had an IM on the computer. For some reason I left the radio in in tune mode and forgot about it. About 10 minutes later there was a puff of smoke and the main fuse blew. I let the thing cool down for awhile and replaced the fuse - so far everything seems ok - I can't find anything that looks burned and I'm getting full output. Is there anything I should check?

Unplug the rig let the high voltage drain and then discharge it.

Check the 10 ohm resistors on the Final Unit board R2 and R3, they are in parallel and should read 5 ohms. They can be measured in the circuit. Also see if they look damaged. Or get new ones at Radio Shack or Fry's and replace them. Use 1 watt only. DO NOT INCREASE THE WATTAGE. They double as a fuse.

Next, look for a choke coil L1 connected to the bottom of the long plate choke. See if this looks fried. DO NOT replace it unless it looks burnt. If you do replace it, you will have to re-neutralize.

On the high voltage unit find R5 and R6. These are 56K ohms 1/2 watt. Also find R-7 this is 12 K They also should be available at Radio Shack or Fry's. They should be replaced as preventative maintenance anyway. The smoke came from somewhere.

Is the power output higher than usual on Tune? If so replacing R5 will fix that.

Now, If you are not experienced in soldering, you can probably get by for now since the rig seems to be working. But if you are able to replace all of these resistors, it would be good preventative maintenance anyway. They are very inexpensive.

Subject: [TS-520_820_530_830] Yikes! Almost blew up my 520. :(

I was in the middle of tuning and had an IM on the computer. For some
reason I left the radio in in tune mode and forgot about it. About 10
minutes later there was a puff of smoke and the main fuse blew. I let
the thing cool down for awhile and replaced the fuse - so far
everything seems ok - I can't find anything that looks burned and I'm
getting full output. Is there anything I should check?

9343. Corrected Audio Improvement in Kenwood Hybrids

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-09-09 12:31:02 UTC
From: n9wb
Topic: 9343 Message: 9343

Humm:
I was 30 years old in 1979. For some reason I can't remember as well as I did then. After reading the posts regarding the question Pete asked and the response from Max and I got to thinking.

I started remembering that I made a mod in my olde TS-820S like the one that they were talking about. That 820 was destroyed in an accident, but I have another one and I have always felt that the transmit audio was not quite as good as the olde one. Now I know why.

Anyway, this can be done to the TS 520,820,530, and 830. Here is the scoop. I have also posted this in the files section of this group under "Mods"
.....
.....
Audio Improvement in Kenwood Hybrids-corrected

The transmit audio quality of the TS 520, 820, 530, and 830 can be improved. This will make the audio less muffled, more open sounding. It will improve articulation and presence.

With the exception of the TS-520, these rigs have a .015 microfarad capacitor (sometimes labeled 153) from the collector of the mike pre amp transistor to ground. This can be changed to a .001 microfarad capacitor (102). Here is where it can be found.

TS-820
This capacitor is labeled C-100. It is located on the IF board on the lower left half between T-15 and Q-20.

TS-530

This capacitor is labeled C-53. It is located on the IF board. Near the center of this board there is a 7 pin connector labeled 12. Next to it is Q11, R66, C 53 and C 54. C-53, is next to the round capacitor C-54.

TS 830

This capacitor is labeled C-106. It is located on the IF board.
On the IF board there is a connector labeled 7. It is along side of CF 3. In that area you will find Q 19. C-106 is between Q 19 and the connector.

TS 520

The TS 520 has instead a .01 microfarad capacitor (103). It is labeled C-16
It is between Q3 and Q6 on the Generator board on the lower right side.
This can be changed to a .001 microfarad capacitor (102).

Thanks for the excellent notes Walt. I just finished swapping up C106 in my 830, and will run some tests to see if there is any change. I did want to point one thing out...

When unplugging al the harnesses from the IF board I mark the connector number on the back of the plug, that way there is no mistake when you put it back together. I have found however, some of the board side connectors came right out off the board while attempting to unplug the harness. As if the solder dried up and a hole straight through. I took this opportunity to go around the board and reseat all the connectors.

I purchased the program Hamalyzer last nght after using it for the ten day period. I have yet to hear from it's creator yet with my registration key so until then I am unable to run some tests.

Thanks for the great info Walt.. I looked back in my notes and I had replaced C106 with a .0022uF cap a while back and guys I talked to all the time noted a tremendous improvement in the transmit audio quality. Not sure if dropping a .001 in there would have much further effect.
Max, when I bought the HamAlyzer program he took a few days to get back to me also. Nice program though...

Thanks Rick, I'll give it some more time. I used the trial version
many times and really liked it so I finally decided to buy it! Judging
by what I am hearing in the 830's monitor I realy can't detect any
difference after the capacitor swap. I'll update when I find out for sure.

Rick and Max.

I changed out C106 in my 830 yesterday, and I used a 0.003 mfd to replace the 0.015 mfd. I used my audio oscillator to check power output before and after the changeout. At 2600 and 2700 Hz, the RF power output increased about 20-25 percent, and I can hear some improvement using my headphones (assuming my memory is any good!). I think an audio analyzer program will be a good tool to evaluate changes. I've had several QSO's today and everyone says the audio sounds clear and crisp.

Hi Max,

It is like trying to check your own bad breath..Hi Hi.. You can't perform audio checks on yourself using just your ears... . I have listened to myself on the monitor using two different mics and can't tell any difference, but doing the same checks on the air have people reporting quite a bit of difference. I was comparing a MC-50 and Shure 444D. I kept the Shure by the way.
Get on the air with someone you talk to all the time and do your audio checks.

Hi Bill,

Very good on the capacitor swap. It is amazing sometimes how making one little change can make such a difference. I think the results with the audio roll off capacitor change will depend on how deep or high pitched one's voice is. Someone with a lot of low frequency in their voice can sound muddy on the 830S as the stock TX audio rolls off most of their highs. I don't have a real deep voice but doing the cap mod make a big improvement in my TX audio.

Hi Reuben,

I'm not sure if you are aware of this or not.So I'll say it in case you don't. 6146W tubes are a high dissipation tube. They produce less out put than a 6146B tube. I run 6146B tube is the original tube sold with an 830 radio when new. It generally works best with these radios since they were made around them.

Now a 6146W tube can be substituted in many times and are more readily available probably and the 6146B. The power output is less but is good for driving a linear. I use B's and drive a linear but I so often times right now especially, run barefoot.

That was just in case you didn't know.

Ruben Echevarria <ka2hhb_2000@ yahoo.com> wrote:

Check the bandswitch Joe..I get that at times with my #1 TS830S and I jiggle the bandswitch and it comes right back. I have to pickup some DE-Oxit and clean it properly. TV tuner spray works but it leaves an oily residue that I don't care for.
Also the connector on the right front of the IF board check that as well, I lost receive and tx was low, was checking the connectors one by one until I came across the right front connector, I pressed on it with a plastic handle and it came to life. Had to remove the board and resolder the pins checked the rest while I had the board out. The radio seems to be ok now. Working and loading as well as my other #2 TS830S.

Hi Max.

Today I was using a Shure 55SW because I thought it had the flattest response and I wanted to know what the radio's audio bandpass was doing. I also use the MC-50 and Shure 444 on my Kenwood radios. The MC-50 is probably similar to the 55SW, but the 444 has more "punch" around 2000 cycles - similar to the D-104. Most people I ask say they prefer the 444 audio when I switch between the mics on Kenwood radios. On my KWS-1, I have switched between the 444 and the D-104 when talking to my brother (who knows my voice) and he cannot tell the difference on that transmitter.

Another result today was that one of the really strong stations I talked to preferred that I use the compression because he said it added low frequency response and made the overall audio sound more "brilliant". He was using the Icom 756ProIII with a wide audio setting. Normally I do not use compression, and I always thought it added to the high frequency content - not the low end. The amount of compression I used was very low - it did not even move the compression metering - just added to the average plate current a little bit.

Sorry about the long answer to your short question Max.

Dave:

Once we ran into a situation where this did this only if the external speaker was plugged in. Try transmitting without anything plugged into the ext. speaker or phone patch in or out. As I remember, this was with a 830. If removing the ext. speaker solves the problem, get back with us and we can come up with a fix so you can use your external speaker.

Subject: [TS-520_820_530_830] TS-830 audio distortion 21-28MHz

Hello

I hope someone can give advice on a long-standing problem with my TS-830.

The problem is audio distortion only on 21, 24 and 28MHz. It sounds like RF feedback, but also occurs when I connect a dummy load so I guess isn't due to RF feedback from the antenna. The other symptom I have is low SSB power output on 24/28 MHz but I can still get 80-100W on CW on these bands. I seem to have to turn the mic gain up much higher on 24/28 and have difficulty in getting any ALC response. If I turn the mic gain down (no ALC reading, about 5-10W SSB peak output on my power meter) the audio distortion disappears and all seems well. So it seems to be related to either to power output or to the level of audio drive.

I have tried tweaking the RF coils on 21-28MHz, but no improvement was seen. Also, because I originally suspected that the problem was caused RF feedback from my antenna, I have tried all the grounding, ferrite filters on connecting cables etc, but this made no difference either. Over the last year I have also changed the 12BY6A driver tube.

I'm using an unmodified MC-50 mic (also have another MC-50 with a Heil HC-5 element, but this gives the same problem).

I've reached as far as I can go and would welcome any help or suggestions about what is causing this problem.

Hello Walt
I tried removing the external speaker (I have an SP-230 with internal DSP unit fitted) but this had no effect. However, thinking along similar lines to your suggestion, I tried removing the external VFO 230 connection, and this did seem to make a difference. With VFO cable removed the audio sounded much better and with no distortion. Also the flashing display I had before on max power transmit disappeared. So, the external VFO may well be part or all of the problem.

Do you have any suggestions why this is happening and how I can cure the problem? Could it be simply a bad connection or perhaps a problem with internal shielding? Does this explain why it happens only on 21MHz and above?

This is big progress on a problem I've been trying to solve for about 9 months. Many thanks for setting me off in the right direction.

73

Hello..I have all the Kenwood hybrid models which I really enjoy. I have followed advice from this group and done well with applying fixes when neceesary to my rigs. I just encountered a problem with my TS 820S that I need help with. When I turn the AF gain up to get to a comfortable volume the AF output seems to go into oscillation...gives a distorted whine like sound...any ideas? Thanks...Jeff...W0XV

response and I wanted to know what the radio's audio bandpass was
doing. I also use the MC-50 and Shure 444 on my Kenwood radios.

Currently Bill I am using a Behringer XM8500 into a W2IHY 8 band EQ.
Sounds nice but I don't get the same drive as I do with th MC-50. But
the MC-50 sounds flatter. I haven't hooked the MC-50 through the EQ
which I may do at some point just to hear what it sounds like.

Gordon
Finally got a few minutes this morning to follow up on your advice. Opened the control unit and cleaned the connectors inside it. Worked like a charm. I have been down in the dumps this week with this problem with the 820s and yesterday my Clear Channel AR-3500 10/11/12M rig went south as well. I figured out how to do a CPU reset on it and it is happy again. (Anyone have an old PA for this rig?) The 820s is happy again. Barry is happy again. Thanks ever so much.

By the way while I was inside the radio I took note that it has an Inrad 94 21Khz filter. Is this a good choice? I have a very deep voice (40 yrs of cigarettes and single malt scotch) and am using an Electrovoice 638 mic.
best regards
Barry

You most likely have an open bypass capacitor on the audio amplifier B+ line, which causes positive feed back into the audio amp resulting in the oscillation. Check the electrolytic bypass cap on the audio amp B+......

Just before I do this I would like to confirm that C100 is the green cap labelled .001 to the lower right of T15. There is a small electrolytic between T15 & the green cap. The reason I ask is on my IF board (the board with the filter) T15 is located in the lower right quadrant, not lower left. This is facing the component side with the filter in the upper right quadrant.
I have a number of small brown ceramic? disks labelled B102. Is this the correct replacement?

Dave,
Are you using an ORIGINAL VFO cable ? The reason I ask is, the
original cable has 1 wire inside it that is shielded.

I had this problem on an 830 that had a really dirty spot on the AF control pot.
Try some De-Oxit in the pot and work it back and forth. Then fire the rig back up and see how she works.

From: Jeff Brown
Topic: 9369 Message: 9369

How come everytime I try to access the files, messages, etc. I get a yellow screen with a blank white square in the middle? The window never finishes loading. My email says I was accepted for membership. Thanks.

Jeff

Max,

I am not familiar with any of the Behringer or W2IHY audio treatment equipment. But some people who use that kind of equipment have told me that you can take a $3 Radio Shack mic element, run it thru audio equalizer type equipment, and it will sound as good as a $500 plus mic. I heard one station demonstrate that by switching his mics, and I could not tell the difference on my stock transceiver - a wide bandpass modified radio might have - I don't know.

I hope nobody starts a "thread" on this comment because there are other reflectors for that purpose. I'm just trying to respond to your message and let you know that you have reached the limit of my knowledge of SSB audio when you insert anything between the mic and the radio! Hi-Hi!

73, Bill, K5GCW

response and I wanted to know what the radio's audio bandpass was
doing. I also use the MC-50 and Shure 444 on my Kenwood radios.

Currently Bill I am using a Behringer XM8500 into a W2IHY 8 band EQ.
Sounds nice but I don't get the same drive as I do with th MC-50. But
the MC-50 sounds flatter. I haven't hooked the MC-50 through the EQ
which I may do at some point just to hear what it sounds like.

Max

Gordon
The cable I have came with the VFO when I bought it used- it
has "MADE LW GERMANY" on the plug. So, I guess maybe it is not
original. I will check inside for shielded wire. Do you know if the
original cables or equivalent are available?
Thanks
Dave

Dave, Pin 1 of the cable is Shielded by pin 7 , according to the VFO
Schematic.
My VFO original Cable is Gray in Color and about 2 feet long.
I don't think the original cable is available any longer.
My cable has NO writing on it but does have a trademark or something
that is a circle with three ellipticals inside of it on each connector.

I agree Bill, and I am at the limit of my experimentation with the
audio and the 830. It sounds fine to me. I worked a station on PSK
this morning on 20m and got an IMD report of -28 which is pretty
clean, so obviously the 830's audio is up to par.

Gordon,
Thanks for info- my cable fits your decription, so maybe it is
original after all. There's also a good description of the remote
VFO cable wiring on this group's web page (thanks Bill, K5GCW).

I opened the connector on the cable ends and immediately saw an open
circuit on pin 7- the shield-on one side. Problem solved?-
unfotunately not quite that easy because even after re-soldering, the
distortion and feedback problem was still there.

However, I think I'm close to solving the problem now, so will do a
careful check of all the cable connections.

I'll let you know of any further progress.

First thing to check is the 9v regulator on the AF/AVR board. VR 4 the 9v control pot often becomes intermittent. Also check for bad connections on this board.

Hello..I have all the Kenwood hybrid models which I really enjoy. I have followed advice from this group and done well with applying fixes when neceesary to my rigs. I just encountered a problem with my TS 820S that I need help with. When I turn the AF gain up to get to a comfortable volume the AF output seems to go into oscillation...gives a distorted whine like sound...any ideas? Thanks...Jeff...W0XV

Dave:

Once we ran into a situation where this did this only if the external speaker was plugged in. Try transmitting without anything plugged into the ext. speaker or phone patch in or out. As I remember, this was with a 830. If removing the ext. speaker solves the problem, get back with us and we can come up with a fix so you can use your external speaker.

Subject: [TS-520_820_530_830] TS-830 audio distortion 21-28MHz

Hello

I hope someone can give advice on a long-standing problem with my TS-830.

The problem is audio distortion only on 21, 24 and 28MHz. It sounds like RF feedback, but also occurs when I connect a dummy load so I guess isn't due to RF feedback from the antenna. The other symptom I have is low SSB power output on 24/28 MHz but I can still get 80-100W on CW on these bands. I seem to have to turn the mic gain up much higher on 24/28 and have difficulty in getting any ALC response. If

I turn the mic gain down (no ALC reading, about 5-10W SSB peak output on my power meter) the audio distortion disappears and all seems well. So it seems to be related to either to power output or to the level of audio drive.

I have tried tweaking the RF coils on 21-28MHz, but no improvement was seen. Also, because I originally suspected that the problem was caused RF feedback from my antenna, I have tried all the grounding, ferrite filters on connecting cables etc, but this made no difference either. Over the last year I have also changed the 12BY6A driver tube.

I'm using an unmodified MC-50 mic (also have another MC-50 with a Heil HC-5 element, but this gives the same problem).

I've reached as far as I can go and would welcome any help or suggestions about what is causing this problem.

IS the ground in good shape? One time not to long ago I had the same problem removed my Amp cable then my remote vfo cable then my speaker cable. It settled down when I cleaned and tightened my ground a little better. I even found the nut loose on the back where it attaches to the 830.

After that I went on a clean up of the 830 to alleviate the last of the whine in the feedback. I popped all my connectors one at a time sprayed and moved them on and off to clean the contacts. I also cleaned all the swiches and the wafer band switch I could get at. I loosened out all grounding screws cleaned and run in and out.make sure they are good and snug, but not so tight they strip. make sure of your mike ground too.

It was explained to me that sometimes when these radios set for a couple of years in an area where the humidity may be higher or conaminents are in the air they settle in the places and cause problems.

This is what I was told to do and it worked for me. lectra clean by CRC is what I used since it doesn't leave a residue. But watch it around plastics like your relay cover or paint on the case.

Hi Jeff and welcome to the group. I ran into this not to long ago when I was talking with Reuben about his pictures and Iwas trying to look at the archives. I found the problem disappeared when I turned off my Norton Internet Security. I saw the effect for but a brief moment and turned the NIS back on. Mine showed up right after the Windows defender appeared on the tool bar. It might be the same problem for you. Try it and see what it does.

Watch for them on E-Bay. They appear often enough. Set your account up to monitor for that and report back to you when it finds it. I've been doing that for a KB-1 knob.

Barry:
On the filter, it is a matter of opinion. In my personal opinion the 2.4 kHz filter will sound much better than the INRAD 2.4 but the INRAD 2.8 will be even better. However if you work a lot of contests under very crowded band conditions. The INRAD 2.4 will be more selective but to me sounds like I have cotton in my ears.

Gordon
Finally got a few minutes this morning to follow up on your advice. Opened the control unit and cleaned the connectors inside it. Worked like a charm. I have been down in the dumps this week with this problem with the 820s and yesterday my Clear Channel AR-3500 10/11/12M rig went south as well. I figured out how to do a CPU reset on it and it is happy again. (Anyone have an old PA for this rig?) The 820s is happy again. Barry is happy again. Thanks ever so much.

By the way while I was inside the radio I took note that it has an Inrad 94 21Khz filter. Is this a good choice? I have a very deep voice (40 yrs of cigarettes and single malt scotch) and am using an Electrovoice 638 mic.
best regards
Barry

Perhaps you are looking at the wrong board.

The IF board is the big board that is mounted vertically instead of flat on the left side with the rig facing you. Looking at it from the component side, the filters will be in the upper right. C-100 is a .015 or (105) and is located on the lower left quadrant T-15 is the only can located in the lower left quadrant. Near the lower left corner of T-15 is a round 4.7 uf capacitor that is C-101. Below it is C-100 the capacitor that you are looking for.

For reference, just below that is a 100K resistor (Brown Black Yellow) and to the left of this resistor is Q 20.

Again, the capacitor is a .015 and is to be replaced with a .001. It is just below the round C-101 The new capacitor with a value of .001 will probably be physically much smaller than the original .015.

Walt
Just before I do this I would like to confirm that C100 is the green
cap labelled .001 to the lower right of T15. There is a small
electrolytic between T15 & the green cap. The reason I ask is on my
IF board (the board with the filter) T15 is located in the lower
right quadrant, not lower left. This is facing the component side
with the filter in the upper right quadrant.
I have a number of small brown ceramic? disks labelled B102. Is this
the correct replacement?

Gordon and Others:

This is a good point. I have noted some people are making their own cables and may not be using a wire with one shielded lead. If the correct wire is hard to find the thing to do is to use a piece of coax, RG 58 with a stranded center or miniature coax such as UG-174. Connect the shield to pin one and the center to pin 2 at each end. Then use a 6 wire unshielded cable for pins 3 through 9. It would be a pretty good idea to have both wires close to the same length.

I have noted that some cell phone antennas have miniature coax. This may be a source for miniature coax. You may have to be creative and run a small wire out from pins 1 and 2 in the plug and then attach to the shield and in the case of RG 58, the center.

Gordon
The cable I have came with the VFO when I bought it used- it
has "MADE LW GERMANY" on the plug. So, I guess maybe it is not
original. I will check inside for shielded wire. Do you know if the
original cables or equivalent are available?
Thanks
Dave

Thanks Walt...well I simply pulled the 3 connectors and sprayed with de-oxit and that solved the problem! This rig is so clean inside and out and does not show moisture contamination, and the contact pins looked clean...but...spraying solved the problem...thanks to you and others who responded! 73....Jeff....W0XV

First thing to check is the 9v regulator on the AF/AVR board. VR 4 the 9v control pot often becomes intermittent. Also check for bad connections on this board.

Hello..I have all the Kenwood hybrid models which I really enjoy. I have followed advice from this group and done well with applying fixes when neceesary to my rigs. I just encountered a problem with my TS 820S that I need help with. When I turn the AF gain up to get to a comfortable volume the AF output seems to go into oscillation...gives a distorted whine like sound...any ideas? Thanks...Jeff...W0XV

Dave:

Once we ran into a situation where this did this only if the external speaker was plugged in. Try transmitting without anything plugged into the ext. speaker or phone patch in or out. As I remember, this was with a 830. If removing the ext. speaker solves the problem, get back with us and we can come up with a fix so you can use your external speaker.

Subject: [TS-520_820_530_830] TS-830 audio distortion 21-28MHz

Hello

I hope someone can give advice on a long-standing problem with my TS-830.

The problem is audio distortion only on 21, 24 and 28MHz. It sounds like RF feedback, but also occurs when I connect a dummy load so I guess isn't due to RF feedback from the antenna. The other symptom I have is low SSB power output on 24/28 MHz but I can still get 80-100W on CW on these bands. I seem to have to turn the mic gain up much higher on 24/28 and have difficulty in getting any ALC response. If I turn the mic gain down (no ALC reading, about 5-10W SSB peak output on my power meter) the audio distortion disappears and all seems well. So it seems to be related to either to power output or to the level of audio drive.

I have tried tweaking the RF coils on 21-28MHz, but no improvement was seen. Also, because I originally suspected that the problem was caused RF feedback from my antenna, I have tried all the grounding, ferrite filters on connecting cables etc, but this made no difference either. Over the last year I have also changed the 12BY6A driver tube.

I'm using an unmodified MC-50 mic (also have another MC-50 with a Heil HC-5 element, but this gives the same problem).

I've reached as far as I can go and would welcome any help or suggestions about what is causing this problem.

9389. Installing two SSB filters??

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-09-11 11:02:13 UTC
From: max_ve3tmt
Topic: 9389 Message: 9389

Just sitting here having my morning tea, wondering what would be needed to allow use of a wide and narrow two SSB filter in the 830. I currently have the 3.0 filter in but still have the 2.4 and thought maybe some kind of relay switching could alternate between the two.

Any ideas?

Max VE3TMT

9390. VFO 820 cable

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-09-11 12:08:36 UTC
From: n9wb
Topic: 9390 Message: 9390

VFO 820 cable.
Actually I was wrong in my last post.

Pin 1 is the shielded wire center.
Pin 2 is the shield surrounding the wire to pin 1 .
Pin 3 is the ground for the relay.
Pin 4 is 12.6 VAC to run the pilot light.
Pin 5 energizes the relay when the EXT. VFO is in operation.
Pin 6 is the DC power source for the VFO.
Pin 7 is not used.
Pin 8 RIT out.
Pin 9 RIT DC source.

With the exception of pins 1 and 2, non-shielded wires can be used.
On pin 1 the center conductor of a shielded wire must be used.
On pin 2, the shield surrounding the wire to pin 1 is connected.

Both ends wire identically.
Pin 1 center of shielded wire to pin 1.
Pin 2 shield to pin 2.
Pin 3 to pin 3
Pin 4 to pin 4
Pin 5 to pin 5
Pin 6 to pin 6
Pin 8 to pin 8
Pin 9 to pin 9.

Pin 7 is not used and may or may not have a connection to pin 7 of the other end.

Vy 73, Walt N9WB

9391. VFO 820 and VFOs 230 and 240 cables.

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-09-11 13:10:04 UTC
From: n9wb
Topic: 9391 Message: 9391

Ladies and Gentlemen:

Do not feel bad if I have managed to confuse you. I have managed to confuse myself.
Gordon's post was correct regarding the cable for a VFOs 230 and 240.
The VFO 820 and the VFO's 230 and 240 use different cable wiring and different ends. They both require a shielded cable for the RF output of the VFO.

I have placed the correct information for the cable for the VFO 820 in the files section of this group.
Bill K5GCW has placed the correct information for the cable for the VFOs 230 and 240 In the files section of this group.

Here is a summary of details of these two cables:

VFO 820 cable.

Pin 1 is the shielded wire center.
Pin 2 is the shield surrounding the wire to pin 1 .
Pin 3 is the ground for the relay.
Pin 4 is 12.6 VAC to run the pilot light.
Pin 5 energizes the relay when the EXT. VFO is in operation.
Pin 6 is the DC power source for the VFO.
Pin 7 is not used.
Pin 8 RIT out.
Pin 9 RIT DC source.

With the exception of pins 1 and 2, non-shielded wires can be used.
On pin 1 the center conductor of a shielded wire must be used.
On pin 2, the shield surrounding the wire to pin 1 is connected.

Both ends wire identically.
Pin 1 center of shielded wire to pin 1.
Pin 2 shield to pin 2.
Pin 3 to pin 3
Pin 4 to pin 4
Pin 5 to pin 5
Pin 6 to pin 6
Pin 8 to pin 8
Pin 9 to pin 9.

Pin 7 is not used and may or may not have a connection to pin 7 of the other end.

Vy 73, Walt N9WB

.....

VFOs 230, 240

*** Bill K5GCW is the author ***

I researched the schematics for the TS-830S, TS-530S, VFO-230, and VFO-240 regarding the cable for a remote VFO. I believe you are correct in that the pins appear to be wired direct pin-to-pin on each end of the cable. Here is what I found for the 8 pin remote VFO sockets on the radios and on the VFO's.

Pin 1 - the "hot" Remote VFO signal going to the PLL Unit connector 6 pin 1 (TS-530S). Note that the radio internal VFO signal goes to connector 5 pin 2 (PLL Unit).

Pin 2 - Identified as "RL" going to the AF Unit connector 6 pin 6 (TS-530S). Also identified as "RL" in the VFO-240 and VFO-230.

Pin 3 - Identified as "9" (volts?) going to the AF Unit connector 6 pin 7 (TS-530S). Also identified as "9" in the VFO-240 and VFO-230.

Pin 4 - Identified as "RLC" going to pin 1 of the VFO Assembly X60-1150-01 plug of the internal VFO (TS530S). There is no connection to pin 4 for VFO-240, but there is a connection in the VFO-230.

Pin 5 - Identified as "VFB" going to pin 3 of the VFO Assembly X60-1150-01 plug of the internal VFO (TS-530S). The connection to this pin 5 for the VFO-240 is identified as "MCO". In VFO-230, this signal is identified as "VFB".

Pin 6 - Identified as "0.5" going to the Counter Unit X54-1540-00 connector 1 pin 2. There is no connection to pin 6 for VFO-240, but there is a connection in VFO-230 identified as "5.00".

Pin 7 - This is a ground connection used to shield the "hot" VFO signal lead.

Pin 8 - Identified as "12" in the TS-530 and goes to several places including the Counter Unit connector 1 pin 3, and the RF Unit connector 6 pin 2. In VFO-240 this signal is identified as "14" and provides power to PL1 and PL2. There is no connection to this pin in VFO-230.

I used the interconnection/schematic diagram for the TS-530S for the above references because Kenwood drew it line-for-line , whereas the TS-830 diagram draws one line for multiple conductors where you have to follow all the "breakouts" to figure out where the conductors are going which is a little more time consuming.

It appears that you can use a 6 conductor cable if you only plan to use the VFO-240, or a 7 conductor cable if you only plan to use the VFO-230. But if you plan to use the same cable for either VFO, then you will need to use 8 conductors. The VFO-240 is made to use with either the TS-530S or TS-830S.

This was an interesting exercise. Maybe it helped you a little.

.....
.....

Bill and Gordon, Thank You

Max:

It doesn't require a relay. It uses the CW filter slot and a change in the switching to do this. I have not done it however. I do not think you would see any advantage from changing from the 3 to the 2.4, however, particularly if the 3.0 filter is an INRAD.

Subject: [TS-520_820_530_830] Installing two SSB filters??

Just sitting here having my morning tea, wondering what would be needed to allow use of a wide and narrow two SSB filter in the 830. I currently have the 3.0 filter in but still have the 2.4 and thought maybe some kind of relay switching could alternate between the two.

Any ideas?

Max,

I am not familiar with any of the Behringer or W2IHY audio treatment equipment. But some people who use that kind of equipment have told me that you can take a $3 Radio Shack mic element, run it thru audio equalizer type equipment, and it will sound as good as a $500 plus mic. I heard one station demonstrate that by switching his mics, and I could not tell the difference on my stock transceiver - a wide bandpass modified radio might have - I don't know.

I hope nobody starts a "thread" on this comment because there are other reflectors for that purpose. I'm just trying to respond to your message and let you know that you have reached the limit of my knowledge of SSB audio when you insert anything between the mic and the radio! Hi-Hi!

doing. I also use the MC-50 and Shure 444 on my Kenwood radios.

Currently Bill I am using a Behringer XM8500 into a W2IHY 8 band EQ.
Sounds nice but I don't get the same drive as I do with th MC-50. But
the MC-50 sounds flatter. I haven't hooked the MC-50 through the EQ
which I may do at some point just to hear what it sounds like.

Max

9394. Wide SSB filter for 830s?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-09-11 12:29:53 UTC
From: Darwin, Keith
Topic: 9394 Message: 9394

Hey all,

I did some SSB with the newly acquired 830s this weekend. It seems to work well enough but I was no able to get any comments from anyone other than "59 1282 QSL?" :-)

My 830s has a SN in the 4 million range and has both 500 Hz CW filters installed. Overall it is fairly clean. I opened it up and used DeOxit to clean many of the pots and most of the switches along with the bandswitch. I also reseated the board attachment screws. The few issues I had seen with it went away.

I did some comparison listening with my Drake 2B. I hooked both rigs up to the same antenna, tuned the same signal and listened to them through the same set of headphones. My el-cheapo behringer mixer served as the means to get the headphone output from both rigs into my one pair of headphones.

The 830s sounded every bit as good as the 2B and the 830s had a much better AGC action. When I switched the 2B to 3.6 KHz, of course, it made the 830s sound muffled and limited (frequency wise). That got me thinking about wide SSB filter for the 830s.

What's involved with changing to 2.8 KHz or 3.0 KHz SSB filters in the 830s? Is it just unsolder the existing filter and solder in a new one? How many filters are involved? I assume 2. If one changes to wider filters I assume the VBT continues to do it's job allowing one to reduce the bandwidth for contest weekends and QRM elimination? What is the source of the wider filters, INRAD?

Hi Max,

I would just keep the 3 khz. filter in there and play with the VBT if you want to tighten the passband. Walt, the filter is the YK-88S2 Kenwood filter.

Hi Keith,

Kenwood makes a 3.0 khz filter that is the stock 8.83 filter in the 870S...It is the YK-88S2.. The YK-88S1 is 2.7khz which is what you probably have in your 830S now. Going to a 2.8khz. is not going to give you much change.

The Kenwood YK filters are 6 pole monolithic filters. The Inrad filters are 8 pole discrete crystal filters as are the older YG Kenwood filters which are in the 820(S) The Kenwood YK filters are an exact drop in replacement for your stock filter. The Inrads are much larger and must be wired in with RG-174 type coax.

You can also replace the little Murata ceramic 455khz filter with an Inrad filter but they are also much larger and must be wired in. As an experiment, I used two 2.4khz. Kenwood filters in one of my 830S' and wired them in. A YG-88S
and a YG-455S..It has better selectivity than my Icom 765.

Keith,

All you have to do is unsolder the original filter and solder the new
one in. There was one on eBay not too long ago.

Apparantly the 830's had two different filters in the 455 IF depending
on the serial number. One was 2.9 Khz wide and the newest was 3.2 Khz.
Check your filter, if it ends in 5 it is the narrower unit. The wider
filter ends in 12. Doing a sweep on my 830, it has a response of
roughly 110 hz to just over 3K. Still waiting for my serial number
from Hamalyzer to do a proper sweep. I was told by Tyler KA0KA, that
you could just jumper across the 455 filter, but I think it will
affect the speech processing. I am leaving it the way it is.

Hi Max,

It is the other way around. The CFJ455K12 is the newer 2.9 khz filter starting somewhere around 3 million serial number on the 830S. Kenwood still used this filter in the 870S...I have never seen Murata publish the -6dB passband specs of the older K5 but it is > 3khz. according to people that have swept them on a Spectrum Analyzer.

Your VBT and notch filter also use the 455 filter. For lack of a better term you would castrate your 830S....

Hi Max,

Yes, the one ending in 5 is the wider (older) one. I am not sure when Kenwood switched from the YK-88S (2.4khz.) to the YK-88S1 (2.7khz) as the standard SSB filter in the 830S but it must have been around the time they upgraded from the CFJ455K5 to the CFJ455K12 which I understand is ~3 million.

I have been looking for years for a touch-up paint for the front of the Kenwoods. I will try Ken's web site. Thanks

Hey folks

I had some fun with the 830s last night. I configured my shack for recording. Fed the 830s into a dummy load and hooked my Drake 2B to the vertical antenna. I then transmitted on the 830s and received on the 2B so I could hear what the 830s really sounded like. I routed the headphone output of the 2B plus the mic feeding the 830s into a mixer and then to my PC where I recorded the session. What I heard was interesting.

The audio of the 830s does seem to be lacking in highs and I know it isn't the mic (the recording clearly shows that). Looks like I'll be doing that cap swap that has been discussed here over the last couple of days.

I tried to post the recording to my home page but the FTP server was down. Ain't Adelphia grand? Once I get the file up there I'll post the link so you can hear what I heard.

BTW, if you're interested, I already have a couple of files up there for listening fun. R4A on SSB and on CW.

http://users.adelphia.net/~keithdarwin/R4A_CW.mp3
http://users.adelphia.net/~keithdarwin/R4A_SSB.mp3

Hmm, these links are the right ones but don't seem to be working right now. Maybe soon?

Hi Jim.

Without getting in too much detail as a starting point, the first thing you need to consider is do you want to buy one that has been cleaned up, checked out, aligned and ready to go; or, buy one off eBay (or other site) where you will probably have to do some repairs yourself. A "good deal" is different in each case. The low end of buying a questionable 830 in good cosmetic condition is probably around $250-$300. Buying a fixed up (and maybe guarranteed) 830 can range from $400 to $600 depending on how you buy it. It also depends on your level of interest in working on equipment, and the test gear you have. Over time, some maintenance will be required with this older equipment.

From your comments, you probably want an optional CW filter. Chasing DX may mean that you also want a remote VFO for split operation.

I just started playing with these Kenwood hybrids about a year ago, had never owned one before, and now have the TS-820S, TS-530S, and two TS-830S transceivers. It has been a fun learning experience for me. Hopefully it will be for you also. There are many others on this reflector with lots of experience that I'm sure can give you more specific guidance

Good Luck and Good Hunting.

The one I sold was the one to get (I shoulda kept it).

Gold label only tells you it is not an early production unit. Most of them it seems were produced with the gold lettered name under the VFO. Serial Number is a better indication of age. 2 million is fairly old, 3 & 4 million are more recent and a bit more rare.

The one I had was 7 million & mint. Oh well.

Band switches can develop problems with the linkage which I hear is tough to fix. Better to get one that doesn't have the issues.

The optional CW filters are a minor pain to install. You have to pull many cables and pull a board to solder the filters in. Finding a rig with no filters and then adding them after can be expensive and it may take a while (quite a while) to locate both filters if you want both. It's easier to find a rig with both filters already installed.

The heavy-weight knob is similar. They're hard to find but you can find rigs with them on.

I'm curious why you sold the 850 after working 5BDXCC? Bored with the rig, just wanting a new toy? From what I've heard the 850 is just as good or better than the 830 so I suspect you're not talking about doing an upgrade.

If there is one thing that disappoints me with the 830s (and the reason I sold my other *mint* one) it's the non-QSK operation. I'm 95% CW and find the clackity racket from the relays really detracts from my fun. I find myself timing my CW with the relays and generally being distracted by the noise. The other issue is the CW offset being a bit wide. I prefer a tone of 600 Hz and the 830s is something greater than that (700? 850?).

Bill, K5GCW
Bill, its been my experience if you get one that is not working, be as certain as you can that the owner, or someone else, hasn't tried to do any repairs. If they will be honest with you, is the problem. If it just "quit working" as they say, and hasn't been touched, its usually a lot easier than try to figure out what someone tried to fix. Oftentimes that "quit working" problem is as simple as that vfo jumper, or loose boards, etc.

An old, cold trail is hard to follow, especially when the first guy didn't know where he was headed.

Hi Keith,

Your SSB filter ends in 05 ? Are you reading the Kenwood part number off of it? Like L71-0208-05 ? It should also say SSB Filter YK-88S(1) ...That is the 8.83mhz I.F. filter. The 05 and 12 we are talking about is the little 455khz Murata ceramic filter just above the 8.83 mhz SSB filter. Your 1st I.F. filter is probably either the YK-88S (2.4khz) or YK-88S1 (2.7khz) and the 2nd IF is the ceramic. The CFJ455K12 is a slightly narrower filter at 2.9khz. but it has a MUCH better passband and ultimate rejection than the older CFJ455K5. We are talking in the area of -60dB ultimate rejection here for the newer Murata, A good 8 pole crystal filter will have over -90dB ultimate rejection, but in 455khz these filters are expensive. Most of the selectivity comes from the 1st I.F. filter but I have noticed an incredible improvement swapping out the ceramic one with an 8 pole crystal filter.

Hey Keith and All,

If you want an interesting read go to Rob Sherwood's receiver testing site. He is a broadcast engineer in Denver and runs his own receiver tests in lieu of ARRL's testing in QST. You will notice the 830S (with YK-88 CW filter) has better dynamic range at 2khz spacing for CW than the likes of the Icom 7800, Pro III and Pro II ...They are sorted 'Best to Worst' in narrow spaced dynamic range.

Oh, well I guess I didn't really check the numbers correctly.

I checked the rig yesterday and recall seeing the Kenwood 8.83 MHz filter (green top, YK-88) labeled with "S" and yes, it's part number ends is -05. The smaller 455 KHz filter I didn't pay much attention to although I do recall seeing some small numbers on there ... I think I saw both 5 and 12 but obviously need to have another look.

OK, so are there performance differences between the 88S and 88S1? Was the wider S1 an option or just a later production item?

When I listen to my TX audio (via a complex recording setup) I find it is lacking in crispness. I'm assuming the cap change in the mic preamp will fix that and the difference between 2.4 KHz and 2.7 KHz won't be enough of a change to warrant the swap, especially in a 2nd / backup rig that won't spend a lot of time on SSB to begin with.

- Keith KD1E -

Yep, I've seen that table. What a great piece of work. Just below the 830s, 1 dB worse than the 830s is my main rig, the Elecraft K2.

I'm anxious to listen to this 830s with twin CW filters during a CW contest weekend. When there are wall to wall signals and FT 1000s splattering all over the band THAT will be the time to see what she can do.

Dave, Pin 1 of the cable is Shielded by pin 7 , according to the VFO
Schematic.
My VFO original Cable is Gray in Color and about 2 feet long.
I don't think the original cable is available any longer.
My cable has NO writing on it but does have a trademark or something
that is a circle with three ellipticals inside of it on each connector.
Gordon

Hi Keith,

The S1 is a later production date and replaced the original S.
The capacitor swap will do more for your TX audio than swapping to the slightly wider filter.

Everyone,

Here is a link to a program called Test Tone Generator 4. You can set it up with a predefined audio sweep range and by observing the output on a audio analyzer you can see exactly the receive and transmit bandwidth of your rig. It is a free trial version. I posted the sweeps of my 830 in the photo section. As you can see I have that annoying 60 hz peak.

Hello folks - new member here with a Kenwood TS-520SE which works great.

I would love to modify my rig for better audio. What filter does the TS-520SE use? Any possibility of being able to install a "wider" filter?

It sounds surprisingly good for 400 to 2600 Hz -6db. But, I'd like to do better! In a perfect world, I'd like to be running 100 to 3400 -6db.

Phil VY2PR
PEI Canada

PS - I also have a Drake TR-4 which I am restoring. Unfortunately, the Yahoo group for the Drake is completely overrun by spam.

Did you take into consideration the audio design circuitry characteristics of the 2B receiver? Knowing how they pass the audio from the product detector through the audio chain would be helpful in determining if you're really hearing your actual audio or some massaged audio to conform to some Drake design criteria. Further, under real world conditions, your audio will never quite sound the same as it might on your local test bench setup given thousands of listeners(with their own "unique" ears), hundreds of different receivers, an almost infinite number of receiver setups (filters, DSP's, variable bandwidth, localized audio receiver tailoring, etc.), QRM, QRN, etc.

It's almost like that age old on-the-air question, "How does my audio sound?" I generally rather ask the question, "Can you hear me?" I generally can get an answer I can believe.

Ken:
My next question is, what is the plate voltage and current when peaked for the maximum whatever you get out ?
Check the RL-1 relay contacts.
With the power off, measure the ohms from the cathode connections to ground. The 4, 20 ohm cathode resistors that are in paralled should read 5 ohms. If they read a lower ohms such as a short, there is a shorted capacitor in the cathode circuit.
Does it have problems on all bands?

Is this being checked on a dummy load? Are you sure the coax jumpers are good? Is the receive OK ?

Vy 73, Walt N9WB

I'm used to how the 2B sounds. My particular unit is a bit rich in the lows while still producing ample highs. I form that conclusion after listening to many SSB and AM signals with the receiver. When it is in 3.6 KHz bandwidth, it does a pretty good job of showing what is and isn't coming of the transmitter since the SSB TX signal is quite a bit narrower than 3.6 KHz.

Absolutely. Which is why I did several things during my testing to try to get results that are closer to real world.

1. Record the output of the 2B receiver so I can hear it when I'm not talking and so others can hear it.

2. Receive the signal off the air in the presence of QRM & QRN. The 2B had no way of knowing the 830s was only 2 feet away, it was still receiving the signal out of the ether and handling it as such.

Now, if adelphia could just get their stinking broken server back on line, I could post the recording and let you all hear it to see what you guys think.

Phil,

Also there is a Drake group at http://www.zerobeat.net/drakelist/ I did some restoration on an R4A (sold it) and currently have a rather nice 2B which I have used to monitor the TX signal from my 830s.

Hello folks - new member here with a Kenwood TS-520SE which works great.

I would love to modify my rig for better audio. What filter does the TS-520SE use? Any possibility of being able to install a "wider" filter?

It sounds surprisingly good for 400 to 2600 Hz -6db. But, I'd like to do better! In a perfect world, I'd like to be running 100 to 3400 - 6db.

Phil VY2PR

Go with a bright white LED and voltage dropping resistor, It will
never burn out again.

Ken,

Maybe the PA RF Choke, L2, was damaged by the Chinese tubes. A few shorted turns might cause your problem. According to the Service Manual, the inductance should be 470uH.

Ken,

There are parts from a TS-530 being sold on e-bay at the present time, although none include the RF choke. If the RF choke in your rig is faulty, then you might be able to get one from the person selling those bits.

Keith, Bill is correct on this because I got my bulbs from Ken, K4EAA and they work great. Ken is also a super nice guy to do business with. His web site is very informative about the Kenwood hybrids.

My 830s has one problem. The lamp for the S-meter is intermittent. The lamp has been replaced at least one time in the past by a prior owner.

What is the right lamp and where do you find them?

The 520 and 530 have a totally different plate choke. The PN you are looking for is L33-0635-05. The service manual is wrong for the PN of L2. Also it has been discontinued by Kenwood.

If there is continuity thru the cholk and it doesn't appear burnt then it's probably ok. Make sure you have HV to the plate of the tubes. Most likely L1 opened up again when the tubes arced.

Does the "No dip" occur on all bands? If so then the choke is fine. It sounds more like a bad switch section if it's only on 1 band

Clif

9447. 830s SSB Recordings

Yahoo group: TS-520_820_530_830 (2006)

From: Darwin, Keith
Topic: 9447 Message: 9447

Well, Adelphia got their server up and running.

I've posted two recordings I made of my 830s. The first one is a recording of the stock rig on transmit. The 2nd recording was made after I changed C106 from .015 uF to .001 uF.

The recording chain was like this.

Sennheiser 835 mic fed into a Behringer 802 mixer. Aux1 output from the mixer feeds the mic jack on the 830s. Headphone output from the Drake 2B is hooked into a 2nd channel on the mixer. The 2B is panned hard L on the mixer and the mic is panned hard R. L & R output are then fed to the M-Audio Delta 44 card in my computer and the two channels are recorded in Cakewalk Home Studio.

No effects, EQ, level changes (other than the obvious fades) were applied to the 2B signal. Gosh, I don't think I even did anything to the mic signal that I recorded.

When I listen to the 2 recordings I can tell the audio is brighter after the modification, but not by as much as I'd have thought. Have a listen and let me know what you think

http://users.adelphia.net/~keithdarwin/TS830s_2B.mp3
http://users.adelphia.net/~keithdarwin/TS830s_2B_Mod.mp3

And the recordings of the R4A are available.

http://users.adelphia.net/~keithdarwin/R4A_SSB.mp3
http://users.adelphia.net/~keithdarwin/R4A_CW.mp3

73!

- Keith -

Ken,

Are you able to measure the inductance? My reason for suggesting the choke was because it may have been subject to high currents when your Chinese tubes flashed over. This could have caused it to heat up, damaging the insulation and shorting some turns together. 2.7 ohms sounds resonable, but by itself doesn't tell the whole story.

Can you confirm that you have 60mA anode current when switched to SSB, that you can get good ALC deflection (a measure of grid current of the PAs) and that the problem is on all bands..

Richard

Ken,

Good luck with the rewind. Incidentally, if you have a 'scope or a general coverage receiver, then maybe a simple Colpits oscillator with known (fixed) capacitors would enable you to verify the inductance by measuring the frequency.

Let the group know how you get on - this all adds to the fund of knowledge.

Richard

Ken:
I see some possible confusion here. L2 is the large plate choke that is connected to the parasitic chokes for the finals. You should look at it and see if it looks damaged. L1 is the small choke on the opposite end of the plate choke. It is probably the one that blew when C-8 shorted. L1 is not all that critical. It's purpose is to aid in keeping RF out of the supply line causing parasitic problems. If L2, the plate choke were shorted internally but enough was left that it was not obviously fried, it would seem to me that your power would be higher on 10 meters and lower on 80. The only thing that this choke does is create a high impedance at RF frequencies and a low resistance at DC so the RF output of the tubes will go to the Pi network instead of being grounded by the B+ supply.

L2 the plate choke, is the one that is 450 uh.
L1 the smaller choke is 150 uh.

I am guessing that your screen voltage and your plate voltage are OK because you are getting 250 ma Ic.
C7 could be open or shorted. If it were open, it could cause these problems. It is .001 High voltage
If it were shorted, you would have B+ on the antenna output and have a fried L5.
L5 could be open or shorted. It is 470 uh.
C 12 could be open or shorted.
TC-1 the neutralization capacitor could be shorted.
The Fox Tango Yaesu group has a site called the Candy Store where they have some new capacitors for Yaesus. You might find a suitable .001 and 100 pf there.

To eliminate most of these possibilities, do the following:

In the final unit, with L5 in place:
With the rig disconnected and the high voltage discharged, measure the resistance between any place on the tank coil and ground. It should show a very low resistance, the resistance of L5.
If it shows a high resistance, L5 is open.

Now disconnect one end of L5:
Make the same resistance check. This time it should show an open circuit.
If it shows any resistance at all, Check both sides of TC-1 the neutralization capacitor to ground. It the resistance is the same on either side of TC-1 Check across TC-1 and tell us what you get.
Check the resistance across C-7 in the circuit.

Inspect L5 check the resistance across it and reconnect it if it looks good.

Now, please humor me.

With the rig connected to the dummy load in the manner that you have been seeing the very low output, remove the coax from the back of the rig and measure the DC resistance across this coax end. It should show 50 ohms or close to it. Now, reconnect this coax and remove

the end that plugs into the dummy load. Measure the resistance across this. It may read a short. If so you can skip the next step. If it does not, with a clip lead connect the center of the SO-239 inside the rig to the rig chassis and check again. Now you should show a short.

What you are checking is to see that the coax path to the dummy load is not open or shorted. Then with the nest check, you are checking to be sure that the coax is making a good connection to the SO-239.

Let us know what you find.

Vy 73, Walt N9WB

From: n9wb
Topic: 9436 Message: 9452

I go to Radio shack and get some 12v bulbs that look like grain of wheat bulbs. They are small and have bare solid wires out the bottom. I often stick a resistor like 100 ohms in series so they will last a while. But if you could fit LED's and a resistor in there, they would last longer.

Vy 73, Walt N9WB

Keith, Bill is correct on this because I got my bulbs from Ken, K4EAA and they work great. Ken is also a super nice guy to do business with. His web site is very informative about the Kenwood hybrids.

Keith, you can get them from Ken, K4EAA.

Subject: [TS-520_820_530_830] S-meter lamp is intermittent.

My 830s has one problem. The lamp for the S-meter is intermittent. The
lamp has been replaced at least one time in the past by a prior owner.

What is the right lamp and where do you find them?

More than likely, the shaft coupler on the band select switch inside the PA Cage is out of sync with the rest of the switches on the RF Board..... WA0WAB

n9wb <n9wb@...> wrote: Ken:
I see some possible confusion here. L2 is the large plate choke that is connected to the parasitic chokes for the finals. You should look at it and see if it looks damaged. L1 is the small choke on the opposite end of the plate choke. It is probably the one that blew when C-8 shorted. L1 is not all that critical. It's purpose is to aid in keeping RF out of the supply line causing parasitic problems. If L2, the plate choke were shorted internally but enough was left that it was not obviously fried, it would seem to me that your power would be higher on 10 meters and lower on 80. The only thing that this choke does is create a high impedance at RF frequencies and a low resistance at DC so the RF output of the tubes will go to the Pi network instead of being grounded by the B+ supply.

L2 the plate choke, is the one that is 450 uh.
L1 the smaller choke is 150 uh.

I am guessing that your screen voltage and your plate voltage are OK because you are getting 250 ma Ic.
C7 could be open or shorted. If it were open, it could cause these problems. It is .001 High voltage
If it were shorted, you would have B+ on the antenna output and have a fried L5.
L5 could be open or shorted. It is 470 uh.
C 12 could be open or shorted.
TC-1 the neutralization capacitor could be shorted.
The Fox Tango Yaesu group has a site called the Candy Store where they have some new capacitors for Yaesus. You might find a suitable .001 and 100 pf there.

To eliminate most of these possibilities, do the following:

In the final unit, with L5 in place:
With the rig disconnected and the high voltage discharged, measure the resistance between any place on the tank coil and ground. It should show a very low resistance, the resistance of L5.
If it shows a high resistance, L5 is open.

Now disconnect one end of L5:
Make the same resistance check. This time it should show an open circuit.
If it shows any resistance at all, Check both sides of TC-1 the neutralization capacitor to ground. It the resistance is the same on either side of TC-1 Check across TC-1 and tell us what you get.
Check the resistance across C-7 in the circuit.

Inspect L5 check the resistance across it and reconnect it if it looks good.

Now, please humor me.

With the rig connected to the dummy load in the manner that you have been seeing the very low output, remove the coax from the back of the rig and measure the DC resistance across this coax end. It should show 50 ohms or close to it. Now, reconnect this coax and remove the end that plugs into the dummy load. Measure the resistance across this. It may read a short. If so you can skip the next step. If it does not, with a clip lead connect the center of the SO-239 inside the rig to the rig chassis and check again. Now you should show a short.

What you are checking is to see that the coax path to the dummy load is not open or shorted. Then with the nest check, you are checking to be sure that the coax is making a good connection to the SO-239.

Let us know what you find.

Vy 73, Walt N9WB

week.
thanks again .
Ken
G3SDW....
> Ken,
>
> Are you able to measure the inductance? My reason for suggesting
the choke was because it may have been subject to high currents when
your Chinese tubes flashed over. This could have caused it to heat
up, damaging the insulation and shorting some turns together. 2.7
ohms sounds resonable, but by itself doesn't tell the whole story.

Topic: 9412 Message: 9455

Ken,

Well done! Great news!.

I look forward to a QSO TS-530SP to TS-530SP sometime - I operate /P most weekends from near Honiton, so not far away.

Richard G3OTK

9456. 830s / CW / Tuning Q's

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-09-14 11:39:30 UTC
From: Darwin, Keith
Topic: 9456 Message: 9456

As I begin to use the 830s more, I find it is a wonderful rig for SSB. Good filtering (though not as steep as the skirts in my Omni V), nice notch, good speech processor and a great sounding receiver - yep, a real winner for SSB.

But for CW I find it is not so hot. I'll learn to live with the relay-based semi-break-in as I have no other choice. I'd like to have an offset of 600 Hz rather than 800 Hz (the manual says 800 Hz, I wonder what it really is). Is the RX-TX offset on CW easy to change?

Is the sidetone pitch easy to change? Is it set to 800 Hz to use as a tuning aid?

These questions all stem from the same basic complaint. It's much tougher to tune a CW transceiver to the right frequency than it is to tune an SSB transceiver. The best I've seen is my old TenTec Omni C. It had a momentary button called Zero Beat. Press the button and the RX offset is set to zero. At the same time the IF is shifted to to center around 0 Hz. Press the button, tune until the CW tone is zero, release the button and you're on freq.

I suppose the technique in the 830s is the same as my K2. Turn on the sidetone (assuming it is set to the same as the RX-TX offset) and spin the VFO until his pitch matches your sidetone.

I'd be happier about it if I liked the sound of the sidetone in the 830s but it sounds choppier than the TX signal does.

Hi Keith,

The newer Kenwood YK-88C(N)-1 CW filters have a 800hz different center frequency than the older YK-88C(N) filters for the 830S. If you drop one of these in your 830S, the offset will be zerot and you can tune 600 hz off and use your IF shift to comensate for receive. You would have to remove the newer filters from the boards they are mounted on, but the pin configuration is the same as the older filters. I have not tried this but it should work unless there is a major flaw in my reasoning....Some of my other projects I have attempted contained this 'flaw' but I always learned something...

9458. Update KA2HHB TS830S

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-09-14 13:44:00 UTC
From: Ruben Echevarria
Topic: 9458 Message: 9458

Hello Walt, once again let me thank you for all the help that you have given me. The TS830S (Gold) is basically working a whole lot better then it was. It's receiving nicely now, meter is not pegging. But I'm still getting no ALC. I read the posting from VK5YKO and basically this is what is going on with my radio. I ordered C74 & L36 parts from East Coast and debating whether or not I should replace those 2 numbers. Is this a common problem?

Does using a filter with a different offset actually change the offset between RX and TX? If I put in a filter with a 600 Hz center freq and then tune signal to that freq is my TX dead on that station or is there still an 800 Hz delta between TX and RX frequencies?

In my K2 and in my Omni V the TX-RX offset is a separate adjustment (to the BFO?) that is independent of the center freq of the crystal filters.

In this regard, I really liked my Century 22. Set RIT to 0, tune the signal for zero hertz to put your TX on freq, then turn the RIT to choose your listening tone and/or peak the signal in the narrow audio filter. Simple, straightforward, obvious.

Hi Keith

If I understand how the 830S works, the radio itself shifts 800 hz in freq when it transmits in CW modes while the newer Kenwoods transmit on whatever freq. your VFO is tuned to. If my line of reasoning is correct, you could use the newer filters to null out this shift, tune for zero beat and use your RIT for whatever tone you wish on the 830S.

I have a question...I have a KENWOOD/TRIO SSB W DIGITAL readout...TS-820 S SSB transceiver..I hooked it up to a G5RV and a VERSA TUNER II by MFJ..

Forgive me here...new at this...do you need the REMOTE VFO-820 to operate or can I use the SSB radio by alone....it does calibrate great on WWV 15,000 Khz...well....for AM MODE Alone...no SSB...is the TUN position acceptable...

BTW...does anyone have a cable for the VFO-820....just incase..thank you..Jerry DE KE7GGV-73...

thank you again...

take care

Jerry;
You only need the VFO-820 if you want to operate in split frequency ie Xmit on one Freq & Rcv on another. The dummy plug is required if you don't have a VFO-820 to operate with the internal VFO only

Hi Jerry,

I don't quite understand your question, but I'll try to answer it with regards to what I think you mean. By the way, I have a TS-820, the first year edition of your radio. Here goes:

1. Do you need the remote VFO to use your 820S? - nope, the TS-820S has a built-in (internal) VFO. The VFO-820 is mainly for use if you want to work split (in other words transmit on one freq., and receive on another that's further away, than using your TS-820S alone, with it's RIT would allow [about +/-5 KHz away from your transmit frequency]). This is very common on 40m, where most non-US & Candian hams cannot operate above 7100 KHz, and as a result work Phone below 7100 KHz, US hams can't work Phone any lower than 7150 KHz (or 7225 KHz if you're a General). So they work split (transmit in the US Phone band, and listen below 7100 KHz). The VFO can be used to control either the transmit freq., or the receive freq. BUT, you CANNOT use it to work crossband (in other words transmit on 20m, and listen on 40m). Bweleive it or not, some people do prefer to use the external VFO, instead of the built-in one. When I was at the Univ. of WI in the 80s, and used to use W9YT (the Univ. of WI ham club station), we ahd a few mwmbers who preferred to use the club's TS-830S, with the external VFo, instead of the internal VFO, even when they were not working split.

2. Can you work AM with the TS-820S? - no you can't. There is a European-only version of the TS-820S called the TS-820M, that will work AM, but unless you're willing to make some major internal mods to your TS-820S (which I've been told, aren't worth doing), you're stuck with SSB & CW. You would have to unbalance the balanced modulator used to help generate SSB. There are other tings that would also need to be done. All the TUNE position is for, is tuning up. Basically it lowers plate current while you're peaking the grid/drive, to minimize stress to 6146B finals. The Tune postion is basically lower output CW.

73 & I hope this clarifies things for you,
Ellen - AF9J

Jerry I looked into tihs myself as you are now. I have the 830 S and remote digital VFO 230 with the 5 memories. I found it better to go get a boat anchor or FT-101 for the AM stuff. Suddenly the neighbors became very intimately known with me. Before it was just dits and dahs to them. Then the donald duck talk. Well needless to say I got rid of the AM Boatanchor When they recited my QSO word 4 word veratim.

So that's my experience I relate to you, of course remember an experience is something you get when you didn't get what you wanted. Emptor Caveat.

The radio club in my hometown of Manitowoc, WI (MANCORAD ARC, callsign W9DK), is cleaning out some of their old gear. They allowed clubmembers (and me as a former officer and club member), to bid on the gear they were selling (some of you may recall me mentioning last month, that I won a Swan 270B in this bidding). BUT, some items remained unsold. I have received permission from both Bill, K0ZL, and MANCORAD, to offer one of them for sale to members of this group. Here is the item:

For Sale:

Kenwood TS-830S, with MC-50 mic, and YG-445CN CW filter. The asking price is $400-$450. The unit was tried out recently on the air, and is in good working order. The CW filter will neeed to be installed. Cosmetically, it is in good shape, except for a small dent in the upper right corner of the cabinet. The price does not include shipping (you'd have to pay for the shipping cost) If you're interested, a photo of the rig can be supplied by MANCORAD. Interested members should contact Fred, W6BSF, the MANCORAD club president. His e-mail is fredandpat@...

73,
Ellen

You do not need the remote VFO but you do need the jumper plug to be installed in the VFO socket. If you have no jumper plug, you can connect pins 8 and 9 of the VFO socket with a piece of a standard size paper clip. If you have no CW filter, you can receive AM in TUN, but USB or LSB will be better.

If your rig is a standard TS-820s, it has no AM mode.

Ruben:

First, we need to establish what is going on with the ALC. If there is actually no ALC, and the processor is off, the output will have no control while speaking. As you advance the mike gain the output will go higher and then flat top going into distortion much faster than it will on the working rig.

So what we need to decide
Is there really no ALC?
Is there ALC but it is not showing on the meter in the ALC position?
Is there ALC but the drive is so low that it will not read.
Does the ALC meter move at all with the mike gain fully up and speaking loudly into the mike?

I cannot locate the post from VK5YKO.

Subject: [TS-520_820_530_830] Update KA2HHB TS830S

Hello Walt, once again let me thank you for all the help that you have given me.
The TS830S (Gold) is basically working a whole lot better then it was. It's receiving
nicely now, meter is not pegging. But I'm still getting no ALC. I read the posting from
VK5YKO and basically this is what is going on with my radio. I ordered C74 & L36
parts from East Coast and debating whether or not I should replace those 2 numbers.
Is this a common problem?

When using your Kenwood hybrid HF rig, which mode do you operate in mostly? CW or SSB?

I haven't had mine long enough to establish any pattern.

With my main rig (K2) I operate 100% CW which is pretty obvious once you realize my rig doesn't have the SSB option :-)

73!

Hi Keith,

I've used my TS-820 for both CW & SSB. I've been a ham for 28 years (and active [with the exception of 2001-2004] since 1982). The lack of break-in keying is no hassle for me; I never used it in the early days, and still don't use it, on even my FT-897D (I find break-in keying irritating and distracting, unless I'm contesting at 30WPM). The same holds true for the 800 Hz sidetone - no biggie for me. This was pretty much standard back in the old days. When I still had the RF-Feedback Master (The IC-703 Plus), and needed more power for SKCC QSOs, I used my TS-820.

But, I mainly use my TS-820 for SSB. It has good SSB audio. Also, while I like to do non-contest CW QSOs occasionally for a change of pace, I've once again decided that if I seriously want to shoot the breeze, I prefer to do it with phone, due to it's higher information exchange rate. Sure, the jerk operator percentage goes up with phone, but most operators are pretty courteous, as long as you're not on that zoo know as 75m (which has been that way for a lonfg time). Some of my most interesting QSOs have been on phone. I remember Christmas Eve 1996, having a ragchew on 160m LSB, with an oldtimer, who it turned it, used to fly B-29s in WW2. His stories were wery interesting to say the least. Getting to that level of chatting on CW, would have taken 2-3 times longer (or maybe 1.5 times longer if 35 WPM CW had been used, with lots of abbreviations).

73,
Ellen - AF9J

Hi Walt and others.

This is with reference to any TS830 suffering low TX power, and a lack
of ALC particularly on the 18 MHz position.
Bands either side of 18 MHz, may also suffer a slight reduction in
maximum output power. The likely cause for this ailment is a shorted L36
and possible also a failed C74 (as was in my case).
My theory is that the L36 failure is likely due to a faulty drive tube,
drawing excessive plate current. Following the failure of L36, it is
possible that C74 fails due to exposed RF form the driver since the
choke is now shorted.

For anyone suspecting the failure of L36 in particular, just follow the
simple instruction below without pulling apart any boards.

With the radio off. measure Ohms from RF board connector 7, most rear
pin to the top of the 470KOhm 1/2 watt resistor lead. That will soon
tell you if it is OK.
Expect to get a reading of around 4 Ohms. Anything much less than that
is considered faulty. If L36 is faulty, then I would replace C74 also as
a precaution.

For those that like statistics, so far the faulty count for L36 stands
at 3.
By the way, it would be a good idea to tune all coils again as other
bands will have been loaded to some degree. (That is if someone has had
a go at peaking the coils with the faulty part in it)

And this is for Walt. You probably couldnt find the link because the
call sign wasnt quite right.
For those interested in the link, here it is

Topic: 9480 Message: 9480

Just finished restoring a 520S - full alignment, tubes up to snuff etc. Power output may be too good to be true.

PO, in CW mode, as measured with a Bird 43 and 120VAC input under load (verified w/ DVM) runs 125 (give or take a couple) on all bands. Ip runs 250MA give or take 5.

This may be normal PO for good RCA 6146's but then again someone may have added a SG mod for more oooomph! How do you confirm if the mod has been installed as I wish to undue it. Thanks,

Joe k7mks

I'm not sure where you're looking Walt, but QST has all their product reviews on line from 1980 on. TS-830 review is there listed as May, 1981. All in PDF form. These are available on the "members only" pages.

But then you could also go to "technical information pages", http://www.arrl.org/tis/tismenu.html
and find many QST articles available for download and/or review. However, many of them also are "members only".
Here's an example of the section on AM operation:
http://www.arrl.org/tis/info/am.html

Lots of great stuff is available on the ARRL pages.

Thanks Gordon, I was doing the C74 & L36 replacement on my board and C71 fell apart.
Looks like I'm headed in the right direction. Ok on your swap that'll be next once I get this going.
Between you & Walt I've been able to do quite a bit. Feels good too. hi hi.
Only thing is the eyes are not what they used to be... But I think I can drive a Pro-Mod.

Thanks To The Whole Group ..... 73 Ruben

Yes,
.047 here Ruben for C71.
I just swapped out my C106 Cap and I'm getting "Great Audio" reports
with my 830 . I installed a .0015 Mylar cap.

73,
Gordon

From: daveb0910
Topic: 9334 Message: 9485

Thanks to all those who have responded to my original request for help.

I have now had time to make some more investigations:

The VFO 230 cable was not the original (thanks to those who sent detailed descriptions) and did not seem to have the internal shielded cable for the hot VFO lead. So, I wired in an extra external screened cable just to carry the VFO signal. This had a positive effect, in that the SSB power output went up on 10 and 12m to the expected range and the mic gain was nearer the normal setting. Also, the worst of the effects (flashing display) disappeared.

I have noted some new intermittant ALC problems since I repaired the cable (I'd never had these problems before) with ALC not working and audio gain inactive- these I will investigate further but they may not be directly related to the VFO cable.

However, the real test is if the RF-type feedback in the audio has been cured. This is harder for me to check on my own, but it does seem improved if I monitor the audio. To be sure I will need to make a few QSOs on 10, 12, 15m. Of course, these bands are just about dead at the moment, so I may have to wait until 2007!.

Thanks again for this excellent group and for your help.

I'll report back again to say if the cure is complete.

Best wishes

Dave, G3ZQH

9486. RE: [TS-520_820_530_830] TS830S No Drive on 30m

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-09-17 15:16:17 UTC
From: Ron Hauser
Topic: 7936 Message: 9486

Continuation of my slow troubleshooting, I got to spend some more time on the workbench this weekend.

Walt asked if I had a carrier that I could hear on a nearby receiver when in transmit: Yes. I took an SWL radio and listened, when transmitting in Tune position I can hear the carrier on 30m (also on 20m and 40m).

Clif suggested no load, so look further downstream, possibly bandswitch. I put my RF probe on the connection point where the drive signal wire goes into the final board. When switching to transmit in tune position:

20m peaks up to ~25v then settles down to ~3v
40m peaks up to ~25v then settles down to ~3v
30m rises smoothly to 5v with no peak.

What I want to do now is to see if the drive signal is actually getting to the tube, which I think would verify that the bandswitch is the problem. However, I am being very very cautious poking at the bottom of the finals because of the high voltage. After careful scrutiny of the board drawing and schematic I think I am expecting to see the drive signal on pin 5 of the final socket. Can anyone verify before I poke a probe into a high voltage circuit?

Thanks!

Subject: [TS-520_820_530_830] TS830S No Drive on 30m

Greetings Kenwood Gurus. About two months ago I was working along with Joe Sloss K7MKS, Bill Schurlock KG5CW, and Joan from Down Under VK5KYO. Bill helped get me set up with a VTVM, I eventually got an RF probe made, and finally I have done some testing.

The problem:

I have a TS830S that I got from the previous owner about a year ago. There is no drive at all on 30m, no matter the position of the drive control knob (also no RF out). All other bands produce drive (and I've had QSOs, seem to be working fine). It receives just fine, I've listened to WWV and various CW and digital QSOs on 30m. I have verified that the WARC bands have been enabled by snipping wire #1 on connector #6 according to the manual. I've

tried lots of wiggling of the bandswitch, also poking carefully at the bandswitch contacts, also tested resistance on the bandswitch contacts which are outside the finals cage. No wiggling ever gives a twitch of drive, and all the contacts outside the finals cage show continuity. On receive the drive control does peak the signal.

Based on Joan's problem with a missing band, I tested C74 and L36 on the RF board. I believe that both these components are ok -- L36 showed right at the 4 ohms level Joan was looking for, and C74 is not shorted and doesn't look burned or anything.

I then took Joe's advice and attempted to measure the RF voltage on the grid of the driver tube. I believe this is a promising path, but I must first verify that I measured on the _correct_ pin. So. I have the radio sitting right side up on the bench with the covers off, the RF board is exposed and the driver tube is right there in the middle. I'm looking down at the tube/socket from above -- actually I am also looking at the board layout diagram in the service manual, which is the same orientation of course. I'm a little fuzzy on the "proper" numbering order of the pins. But anyway in this orientation the gap with no pins is at 9 oclock. There is a pin at 8 oclock, one at 7 oclock, one at five oclock. After staring at the diagrams and thinking about it for a while, I believe the pin at 7 oclock is the one that I want. So I put the rf probe on that pin and with the rig in tune, I switched to send and indeed I got RF.

Question #1. Am I on the right pin (or if not what am I measuring!?!)

Question #2. If I am on the right pin, I have an interesting result, because the RF voltage is not the same. At 14110 kHz I got 1.5 V. At 7110 kHz I got 1.4 V. But on 10110 kHz I got 5.2 V. Hm!!!

Subject: [TS-520_820_530_830] TS830S No Drive on 30m

Hi Joe, understood. I had come to a similar conclusion this afternoon after our previous emails; a VTVM would be very handy right now. I'm going to proceed as recommended, I will build an RF probe to use with my DMM. I will also keep an eye out on Ebay and the other sites for a VTVM which is what I really need. Using whichever of those I get hold of first I'll start tracing as you recommended.

To restate the problem for future reference: I have a TS830S that I got from the previous owner about 8 months ago. There is no drive at all on 30m. All other bands produce drive (and I've had QSOs, seem to be working fine). It receives just fine, I've listened to WWV and various CW and digital QSOs on 30m. I have verified that the WARC bands have been enabled by snipping wire #1 on connector #6 according to the manual. I've tried

lots of wiggling of the bandswitch, also poking carefully at the bandswitch contacts, also tested resistance on the bandswitch contacts which are outside the finals cage. No wiggling ever gives a twitch of drive, and all the contacts outside the finals cage show continuity. On receive the drive control does peak the signal. Therefore my current thinking is to look for trouble somewhere besides the bandswitch, my best thought being to check C74 and L36 on the RF board as noted by Joan VK5KYO.

I've changed the subject to more accurately reflect this issue, so that it will be easier to find in the future. I will have some time to work on the radio again tomorrow, then I'm out of town for vacation and for work for a few weeks. I'm archiving all these conversations so that I'll be able to come back to them.

I appreciate your coaching.

Subject: Re: [TS-520_820_530_830] TS830S low power

Ron: There are several Heath RF probes on ebay that could be adapted to use

with your DMM. Handiest thing in the world when you need one.

The fact that your DRIVE control peaks a received signal tells me that the BS and associated circuits on 30m may be OK.

I was going to ask you to measure RF voltage at the grid of the driver tube.

Do this on 40 and 20 when you are in the TUNE position. Then check 30m.

If you have about the same RF voltage then the 30m circuits BEFORE the grid

are working correctly. If the 30m voltage is lower or non-existant then your problem is before the grid of the driver tube.

Before I go too far you might refresh my memory as to the problem you are having. I think I've deleted some of your earlier comments on what was wrong and what does what.

9487. 12by7a (again)

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-09-17 11:36:48 UTC
From: elamcreekranch
Topic: 9487 Message: 9487

My perfect solution to no drive response by replacing the 12by7a tube did not last long. After transmitting for perhaps an hour, the same problem returned. Problem being no response to peaking the drive--meter just fades off to nothing.

On the first failure, I presumed that since the 12by7a was perhaps 25 years old, it just failed from age, but now that the new one failed so soon, I am wondering if some component associated with this tube is the real root cause. Heater switch checks out okay, bias has been less than 60 ma, etc.

any and all ideas to check are appreciated!

rltusch kg5iq

9488. Repost VK5KYO

Yahoo group: TS-520_820_530_830 (2006)

From: Ruben Echevarria
Topic: 9488 Message: 9488

I am taking the liberty of posting this.
This is good information from VK5KYO.
N9WB
Hi everybody
For those interested in my original posting of the message, read below.
I am assuming that no other person has seen this problem before, except Bill-K5GCW who got in contact with me and explained he has the same problem with his 830, even after spending some considerable time cleaning the wafer switches.
Well if you read this Bill, I have found the problem(s). If your lucky, it may be the same problem.
A recent posting by another Bill-WB5DX, who cleaned the switches with de-oxid?? and has gone backwards in the process, may also be interested in reading this, because I think Bill may have disturbed the rivet connections of the wafers, or maybe some cleaning material is lodged in the switch as it is difficult to get in there, or he may have even bend some of the contacts. Its not hard to do.
Anyway
I did as what most of you would do and that is to remove the RF board, number each wafer, desolder each one and clean the switches and while it's out, you also solder each wafer contact to the track of the switch. This requires a lot of patience and a bit of skill to reassemble and realign all the switches before soldering them back on the board.
I found a number of contacts which were loose. The rivets were not doing their job anymore. The material must have shrunk a little. This is why you have to solder them, if you want the 830 to be reliable.
Now in Australia I heard of a saying, that whenever something gets serviced (be it electronics or otherwise), they say that "it has gone in for a grease and oil change".
It's a funny expression but when I pulled apart this wafer switch, I could relate to that. 2 of the switches had a liberal coating of a thick, greasy substance, and the RF board had a coating of what appears to be oil. It was a big cleaning job.
But all the cleaning and soldering made absolutely no scrap of difference. Still very little output on 18MHz, and no ALC at all.
I lost track of the number of times I pulled that RF board out.
For those that havent worked on these, you can make only limited measurements because the way it's mounted, and access to the track side of the board while it is switched on is near impossible.
I knew where the problem area was, except everything appears to be checking out. eg component values, connections, switches etc etc.
Then I found a bypass capacitor C74 which measured 500 Ohms I replaced and with excitement put it together. I improved the output on 21 MHz considerably, but still not much happening on 18.
If you study the circuit, you will wonder how this capacitor could have

an affect on the output. (It all makes sense later on)
Then tonight, I finally had a breakthrough. I have been so close for days but missed it.
The neighbouring component to C74 is a RF choke L36. This choke has gone nearly short. It measured 30uH with a large D factor. The original value is 470uH.
Needless to say, I was very excited to have found it long last. I put it all back together and aligned the RF board again and output on 18 MHz was finally achieved. Output on 21 MHz was also restored. All in all, a good outcome.
I have learned a lot from this repair. One of them is that the circuit from Kenwood has mistakes in it. One that led me on the wrong path for some time until I checked the circuit board against circuit.
You know, I could have sworn it was going to be a band switch problem from all the symptoms it gave and I would have never guessed the faulty components. When you check everything methodically and logically over and over and over again and it still dont work, you know your in a bit of trouble.
So in the end, finding the problem, was it a fluke, lucky maybe? I dont know. What I did learn, was to make no assumptions, lots of patience, be tenacious, dont doubt what you have learned in the past, how the circuit works and I can go on. I feel great about it and someone more experienced may have done it in a tenth of my time, but you can never put a price on what you learn. I am sure the owner of the rig will be very happy too-No charge.
I know the story is a bit long winded, but I hope that for some of you readers that may develop this fault later on in the rigs life, you will save some time repairing it and get it back on air asap.
73 from down under
Joan VK5KYO

Be advised I also had to replace C71 as it fell apart upon my touching it....Ruben KA2HHB

9489. Antenna Question

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-09-17 17:53:41 UTC
From: Stephen Davis
Topic: 9489 Message: 9489

Hello All,

This is a little off topic but while I am waiting for approval to join the Antenna Group, I thought I would post here. After all, the antenna is attached to a Kenwood TS-820S!!

This past Friday I put an inverted vee antenna up about 25 feet. The center mast is a wooden 2X2 that attaches to the side of my patio. The ends come down and attach to my fence. On Sunday, my neighbor came over and complained that his satellite TV had stopped working and when he call Direct TV they told him my antenna was blocking the signals. I took a look at his TV and sure enough, he was not getting any signal. I then took down the antenna and he still was not getting a signal. He is going to call Direct TV and have them come out and check his system. In the meantime I will keep my antenna on the ground.

I don't think it was my antenna that caused the problem, but it was an odd coincidence. That got me to thinking and my question is "Would it be possible for the 100 watts from my Kenwood to somehow cause harm to his satellite TV system, like shutting it down or overloading the satellite dish components? The dipole wire comes within about 20 feet of his dish. I only run on forty and twenty meters. Any thoughts would be appreciated.

In any case, I am the loser here because regardless of the cause of my neighbor's satellite system trouble, as in his mind he will always blame my antenna. Of course Direct TV blaming me initially for the problem did not help!

Thanks

Steve K7QHU

Topic: 9489 Message: 9490

Steve, its hard to say what happened. 20 feet is pretty close. I have a Davis weather station on my tower and anytime I key up the TS530S, (or any other HF radio) the weather station goes bonkers. I saw this morning it said the heat index was 640 degrees. Has your neighbor tried a hard reset on his receiver. I have to do that occasionally for no apparent reason. My dish is probably within 10 feet of the inverted vee with no apparent problems. Good luck, don't let them tell you its your problem.

"I am being very very cautious poking at the bottom of the finals because of the high voltage." <snip>

Wise man. I still have a scar on my arm where I took stored plate cap voltage on a TS-530S (luckily, between my finger tips and forearm), as I carelessly tried to reach around and adjust resting bias with the cage cover off. I knew better, but was in a hurry. It certainly got my attention. Burned a 1/8" hole through my shirt and about the same distance down into my arm. I was lucky to have the opportunity to re-learn this lesson without any more damage than that. Be careful. Take nothing for granted.

Since there's really no such thing as a "new" 12BY7 anymore, I'd suggest trying another tube first, before you start digging around in the radio's innards. Occam's razor generally applies; i.e., the simplest, most logical solution usually prevails. (I've got a TS-440 locked in diagnostic mode, but so, far, I haven't found a simple, logical solution for that problem. Not SMT inside, but close.) GL.

My 6BTV Newtronics Hustler is within 10' of my Dish Network dish. I monitor my transmitted signal with the TV on to make sure that I'm not causing any problems with neighbors' equipment. I run about 600w with my TS-530s driving an SB-200. I can see just a little bit of interfence on 80, and nothing on 40, 17, 30 & 10. 20 m blitzes the TV (even with just the 530), but nothing fails (don't know what the problem is yet w/20, so I limit my operation to off-times for the present.) I've got low pass filters between my Kenwood and the amp, and between my tuner and the antenna.

Your neighbor's equipment failure was probably just conicidence. After his dish service remedies his problem, you might coordinate a radio-transmission/TV-reception time with him to demonstrate (a) your concern & cooperation, and (b) that his problem was not caused by your equipment. Also, having done that, provide him with a high-pass filter (available at RS, etc.) to further buffer any remaining question. (He'd probably have more conficence in a manufactured filter, since he's already suspicious of "amateur" activity.)

I used this strategy successfuly some time ago while living in an apartment complex in Austin, TX. Kept a box of filters at the ready, and had posted a note on the complex bulletin board as to my normal operating hours, operating frequencies, and the availability of the filters. Never had a moment's problem after the initial set-up.

Good luck, Steve.

Steve,
I have DirecTV with two dishes and two Tivo units. My dishes are
within 20 feet of my Vertical and My Force 12 Antenna. I sometimes run
as much as 600 Watts output, and I have NO problems with my Directv
Signals or equipment. I agree with the fellow that suggested your
neighbor do a Hard reset on his Directv receiver box. Also, his LNB
could have gone bad on his dish and if so, he'll get NO signal.
The people you talk to on the phone at DirectV do Not really know
much about the Hardware they install in my experiences.
I hardly think it is due to your Antenna.
Gordon

I transmit with 100-600 watts on many hf frequencies within 20 ft of my Direct TV antenna with no ill effects. I use a trap vertical as well as a 350ft end fed long wire. Part of the long wire is directly over the dish. While it may be possible to cause damage to the Direct TV receiver, not very likley. Kinda sucks though. Like the time my gauges quit working on my Chevy truck. They said it was the low band radio. Good luck.

As a Master Auto Tech for 30 + years, The problem with your gauges was most likely the Ground. Chevy (actually any GM) trucks had a real problem with the instrument panel ground for years.

Steve,

Your incident only show the arrogance that some people have when it comes to amateur radio operators. You could put up an antenna and not transmit on it at all and I bet you would still get blamed for something. As soon as the neighbors see the antenna and they have problems with their TV reception it's natural to blame the ham. First of all, a wire antenna cannot block a satellite signal, unles of course your antenna wire is 3 feet in diameter and it runs right through his dishs line of sight. If the satellite rep told me that, I'd tell him to go back to school and learn something.
As far as your neighbor is concerned, if your antenna isn't over his property line and he thinks your antenna is causing the problems, I'd let him move his dish. It appears that he is already blaming you so let him move his antenna. My R7 vertical is within 20 feet of my neighbors dish and he tells me he has no problems at all. Ham frequencies and satellite frequencies are so far apart in the spectrum, you shouldn't be causing any interference at all. Unless he bought his receiver at the dollar store!

Good luck,

Max VE3TMT

Reading this makes me wonder how many other hams have missed the "trap
door" under the AF unit that allows access to the bottom of the RF
unit. This is good on the 530/830 radios. Remove the AF unit screws
and tilt it over the middle of the radio. Remove the 4 screws and the
plate and there is the bottom of the RF unit, ready for measurement or

repair. The bandswitch can even be replaced without removing the RF unit.

Because of the documented problems with the rivets and traces when a cleaning doesn't help I replace the bandswitch.

On cleaning the bandswitch. DO NOT USE TUNER CLEANER. I turn the radio up on it's side with a rag under it. I then flood the bandswitch with brake cleaner (friendly auto parts store stuff) while turning the switch. Be careful not to get it on anything else, especially painted surfaces. I then blow dry it with air and very carefully apply De-Oxit to the wafers. This will cure 90% of the problems. Any others are usually loose rivets and I replaced the bandswitch.

Clif

All,

Thanks for all the replies regarding the possibility of my antenna interfering with my neighbors Direct TV. This evening I went over to my neighbor and suggested he power down his cable box, unplug it, then plug it back in. He grumbled a little bit about waiting for the technician, but then said they wouldn't be out for a week, so decided to give it a try. Well, when the cable box was plugged back in and powered up, everything was fine and he was back in business. Did he thank me.... not really. He said in three years he had never had to reset the system and insisted that my antenna was the problem. Oh well... But on a positive note, I told him I was going to put the antenna back up at half the height and see if it caused any problems and then if it did not, I would continue to raise the height a little everyday until it was back to the maximum height. I assured him I would immediately take it back down if any problems occurred. He agreed that that was reasonable, so we shall see.

Thanks again to all that responded and thanks to the moderators for letting this slightly off topic thread exist. If no one objects I will post in a week or so just to let everyone know how this story ends.

This all sounds good but a word of caution:

It would have been best not to agree to not put the antenna back if it caused a problem. We are not responsible for problems that are not out fault. An example is harmonic or spurious radiation/Vs fundamental overload. If you interfere with an electronic device, we will use a television as an example, it can be caused by your rig improperly transmitting an emission on the television station's frequency. This would be your fault. However, if because of poor design, the television receiver is being affected by your legal signal on the frequencies you are licensed to operate on, it is not your responsibility.

If you verbally agree to remove your antenna if the problem re-occurs, this can be interpreted as a verbal contract or an admission of guilt and you can be held to it.

I once had a problem that a particular low angle DX antenna that disrupted a television belonging to a neighbor a couple of blocks from my station. The problem was not my fault. He was a sports fan. He was having a group over for the Superbowel. He wanted me to promise that I would not operate during the Superbowel. I avoided making that promise, and even transmitted a couple of times but only for a short tome during a commercial break. He watched his Superbowel and I avoided anything that could be considered an admission of guilt or a verbal contract not to operate. I finally moved that particular antenna, but did not admit that it had anything to do with his complaints.

As far as the satellite guy, years ago we had problems with TV repairmen and cable TV companies telling customers that problems they did not want to mess with were the fault of the nearest Amateur. A letter from an attorney often put a quick stop to this. If you do not have a friend who is an attorney, perhaps the ARRL can help.

It is OK to try to get along with your neighbors and cooperate, but don't make commitments. Just do it.

Subject: [TS-520_820_530_830] Re: Antenna Question

Steve,

Your incident only show the arrogance that some people have when it comes to amateur radio operators. You could put up an antenna and not transmit on it at all and I bet you would still get blamed for something. As soon as the neighbors see the antenna and they have problems with their TV reception it's natural to blame the ham. First of all, a wire antenna cannot block a satellite signal, unles of course your antenna wire is 3 feet in diameter and it runs right through his dishs line of sight. If the satellite rep told me that, I'd tell him to go back to school and learn something.
As far as your neighbor is concerned, if your antenna isn't over his property line and he thinks your antenna is causing the problems, I'd let him move his dish. It appears that he is already blaming you so let him move his antenna. My R7 vertical is within 20 feet of my neighbors dish and he tells me he has no problems at all. Ham frequencies and satellite frequencies are so far apart in the spectrum, you shouldn't be causing any interference at all. Unless he bought his receiver at the dollar store!

Good luck,

Max VE3TMT

I should add that the problem may be caused by your signal getting into the wiring from the house to the dish. It would crash the system and require a reboot. Again, this is not your fault, but would be a deficiency in the satellite system design. It could even be that it is not installed correctly or has improper shielding in some of the cables.
Perhaps adding distance from your antenna to the dish will help the problem but do not commit yourself.
The satellite dealer may rather blame you that resolve his system deficiency. Or he may be clueless as to what to do.

Subject: Re: [TS-520_820_530_830] Re: Antenna Question

This all sounds good but a word of caution:

It would have been best not to agree to not put the antenna back if it caused a problem. We are not responsible for problems that are not out fault. An example is harmonic or spurious radiation/Vs fundamental overload. If you interfere with an electronic device, we will use a television as an example, it can be caused by your rig improperly transmitting an emission on the television station's frequency. This would be your fault. However, if because of poor design, the television receiver is being affected by your legal signal on the frequencies you are licensed to operate on, it is not your responsibility.

If you verbally agree to remove your antenna if the problem re-occurs, this can be interpreted as a verbal contract or an admission of guilt and you can be held to it.

I once had a problem that a particular low angle DX antenna that disrupted a television belonging to a neighbor a couple of blocks from my station. The problem was not my fault. He was a sports fan. He was having a group over for the Superbowel. He wanted me to promise that I would not operate during the Superbowel. I avoided making that promise, and even transmitted a couple of times but only for a short tome during a commercial break. He watched his Superbowel and I avoided anything that could be considered an admission of guilt or a verbal contract not to operate. I finally moved that particular antenna, but did not admit that it had anything to do with his complaints.

As far as the satellite guy, years ago we had problems with TV repairmen and cable TV companies telling customers that problems they did not want to mess with were the fault of the nearest Amateur. A letter from an attorney often put a quick stop to this. If you do not have a friend who is an attorney, perhaps the ARRL can help.

It is OK to try to get along with your neighbors and cooperate, but don't make commitments. Just do it.

Subject: RE: [TS-520_820_530_830] Re: Antenna Question

All,

Thanks for all the replies regarding the possibility of my antenna interfering with my neighbors Direct TV. This evening I went over to my neighbor and suggested he power down his cable box, unplug it, then plug it back in. He grumbled a little bit about waiting for the technician, but then said they wouldn't be out for a week, so decided to give it a try. Well, when the cable box was plugged back in and powered up, everything was fine and he was back in business. Did he thank me.... not really. He said in three years he had never had to reset the system and insisted that my antenna was the problem. Oh well... But on a positive note, I told him I was going to put the antenna back up at half the height and see if it caused any problems and then if it did not, I would continue to raise the height a little everyday until it was back to the maximum height. I assured him I would immediately take it back down if any problems occurred. He agreed that that was reasonable, so we shall see.

Thanks again to all that responded and thanks to the moderators for letting this slightly off topic thread exist. If no one objects I will post in a week or so just to let everyone know how this story ends.

One thing you didn't say about your neighbor saying your antenna is blocking his sat signal was whether it was physically within the "line of sight" of the satellite and his dish. I was assume it's no where near the "line of sight" of your neighbor's satellite and dish antenna.

First, a single 2x2 simply will not cause this problem. In order for a 2x2 to cause this problem it would have to be placed between the LMB and the dish itself. Now six 2x6's, mounted side by side and placed on the dish itself, would most likely cause lost of signal, but not a single 2x2.

Second, your inverted vee is not causing your neighbor's problem either. As ridiculous as it may sound, I once read a post some time ago that said a ham's neighbor believed the ham's antenna was robbing his satellite signal causing fuzzy/snowy pictures, even when the ham was not on the air.

Satellite signals are in the SHF range, far removed from normal everyday ham frequencies in the HF range.

A satellite system has basiclly 3 pieces of equipment, minus the coax; the dish, an LMB mounted on the dish arm pointing toward the dish not the satellite, and the satellite receiver. A satellite dish that has been properly aimed/pointed at the satellite, the received signal is reflected by the dish back towards the LMB. The LMB receives the satellite signal where it is converted to a much lower frequency within the LMB. The converted signal is then fed out of the LMB, through coax, to the satellite receiver.

There are a few things that will cause lose or a reducetion in signal strength of a satellite signal; bird nests on the LMB, snow, heavy rain (down pours), or a huge flock of birds. There is a line of sight setting, both vertically and horizontally, that is required for the dish to be set to in order to receive the satellite signal. Any movement outside of this line of sight will cause lost or reduce signal strength of satellite signal. Of course there is one more thing; the satellite television bill has not been paid causing satellite television service to be terminated.

9504. Neutralization - Dip vs peak power?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-09-18 12:31:32 UTC
From: Darwin, Keith
Topic: 9504 Message: 9504

I went through my 830s and did an alignment per the manual. All went smooth and easy except for the adjustment of the neutralization.

I tried to use an external receiver to neutralize the finals. The results were useless. I ended up adjusting the neutralization by making the grid current dip and peak output occur at the same point.

Later, after I found the RF probe for my DMM, I went back in and adjusted the neutralizing cap per the book. That was easy as pie, but now my rig's peak output and the dip on the plate current don't happen at the same time. If I dip the plate current to say 200 mA, the peak output may occur at maybe 280 or 300 mA.

I went back and adjusted the neutralizing cap to put it partway between the two settings.

What's the right thing to do?

Last night I worked a guy on 40 meter CW. Turns out he was running a TS-830s. We had a nice 830s 2-way.

Ruben Echevarria <ka2hhb_2000@...> wrote: I am taking the liberty of posting this.
This is good information from VK5KYO.
N9WB
Hi everybody
For those interested in my original posting of the message, read below.
I am assuming that no other person has seen this problem before, except
Bill-K5GCW who got in contact with me and explained he has the same
problem with his 830, even after spending some considerable time
cleaning the wafer switches.
Well if you read this Bill, I have found the problem(s). If your lucky,
it may be the same problem.
A recent posting by another Bill-WB5DX, who cleaned the switches with
de-oxid?? and has gone backwards in the process, may also be interested
in reading this, because I think Bill may have disturbed the rivet
connections of the wafers, or maybe some cleaning material is lodged in
the switch as it is difficult to get in there, or he may have even bend
some of the contacts. Its not hard to do.
Anyway
I did as what most of you would do and that is to remove the RF board,
number each wafer, desolder each one and clean the switches and while
it's out, you also solder each wafer contact to the track of the switch.
This requires a lot of patience and a bit of skill to reassemble and
realign all the switches before soldering them back on the board.
I found a number of contacts which were loose. The rivets were not doing
their job anymore. The material must have shrunk a little. This is why
you have to solder them, if you want the 830 to be reliable.
Now in Australia I heard of a saying, that whenever something gets
serviced (be it electronics or otherwise), they say that "it has gone in
for a grease and oil change".
It's a funny expression but when I pulled apart this wafer switch, I
could relate to that. 2 of the switches had a liberal coating of a
thick, greasy substance, and the RF board had a coating of what appears
to be oil. It was a big cleaning job.
But all the cleaning and soldering made absolutely no scrap of
difference. Still very little output on 18MHz, and no ALC at all.
I lost track of the number of times I pulled that RF board out.
For those that havent worked on these, you can make only limited
measurements because the way it's mounted, and access to the track side
of the board while it is switched on is near impossible.
I knew where the problem area was, except everything appears to be
checking out. eg component values, connections, switches etc etc.
Then I found a bypass capacitor C74 which measured 500 Ohms I replaced
and with excitement put it together. I improved the output on 21 MHz

considerably, but still not much happening on 18.
If you study the circuit, you will wonder how this capacitor could have an affect on the output. (It all makes sense later on)
Then tonight, I finally had a breakthrough. I have been so close for days but missed it.
The neighbouring component to C74 is a RF choke L36. This choke has gone nearly short. It measured 30uH with a large D factor. The original value is 470uH.
Needless to say, I was very excited to have found it long last. I put it all back together and aligned the RF board again and output on 18 MHz was finally achieved. Output on 21 MHz was also restored. All in all, a good outcome.
I have learned a lot from this repair. One of them is that the circuit from Kenwood has mistakes in it. One that led me on the wrong path for some time until I checked the circuit board against circuit.
You know, I could have sworn it was going to be a band switch problem from all the symptoms it gave and I would have never guessed the faulty components. When you check everything methodically and logically over and over and over again and it still dont work, you know your in a bit of trouble.
So in the end, finding the problem, was it a fluke, lucky maybe? I dont know. What I did learn, was to make no assumptions, lots of patience, be tenacious, dont doubt what you have learned in the past, how the circuit works and I can go on. I feel great about it and someone more experienced may have done it in a tenth of my time, but you can never put a price on what you learn. I am sure the owner of the rig will be very happy too-No charge.
I know the story is a bit long winded, but I hope that for some of you readers that may develop this fault later on in the rigs life, you will save some time repairing it and get it back on air asap.

Besides the product review from the QST archives which was mentioned in another reply by the group. Some interesting specifications were referenced here on the group not to long ago about different radios. If that is of interest to you for comparison of different radios on topics like selectivity and the like. If that is what you're after look back in the archives. It may take some time but somone did bring those specs in with the reference to the source as a web adress.
Also, E-Ham has an opinions section which some owner operators have placed thier comments about the 830. You'd get to hear what others experienced with the rig.
Lastly, the TS-830 carries a compilation of not just the E-Ham reviews but also mods and other interesting materials pertaining to the TS-830. Look around Page 30.
Hope these things may be useful to what you're looking for.

Two things I'd like to recommend to you.

Fist, try running with a TVI filter. I use RF-Inqiury common mode and Harmonic Rejection types. this helps keep a clean signal.

Second, what was you're ground? Sometimes a ground can make or break an interference problem. Some people in apartments run a counterpoise wire around the floors for ground substitutes. Some have made the mistake of trying to use the using the AC line ground which can cause alot of headaches. Or worse yet, the same ground that the cable-TV is on.

Third, how close is the radio equipment running to the cable equipment. Maybe placement of the transmitter to a different spot is what you need.

Now I don't promise any or all of these ideas will necessarily solve the problem. But between my experiences in an apartment with my 830 and what others have Encountered, these ideas were some things to try that made some difference. After all 100 watts in a small area can be a challenge.

One person on the group that as I recall has a TS-820 in an apartment is Ellen R. You may try to ask her about this experience and any suggestions. The problem may not even be related to you. There's alot of factors that come in to play.

Stephen Davis <sdavis@...> wrote:
Hello All,

This is a little off topic but while I am waiting for approval to join
the Antenna Group, I thought I would post here. After all, the antenna is
attached to a Kenwood TS-820S!!

This past Friday I put an inverted vee antenna up about 25 feet. The
center mast is a wooden 2X2 that attaches to the side of my patio. The ends
come down and attach to my fence. On Sunday, my neighbor came over and
complained that his satellite TV had stopped working and when he call Direct
TV they told him my antenna was blocking the signals. I took a look at his
TV and sure enough, he was not getting any signal. I then took down the
antenna and he still was not getting a signal. He is going to call Direct TV
and have them come out and check his system. In the meantime I will keep my
antenna on the ground.

I don't think it was my antenna that caused the problem, but it was an
odd coincidence. That got me to thinking and my question is "Would it be
possible for the 100 watts from my Kenwood to somehow cause harm to his
satellite TV system, like shutting it down or overloading the satellite dish
components? The dipole wire comes within about 20 feet of his dish. I only
run on forty and twenty meters. Any thoughts would be appreciated.

In any case, I am the loser here because regardless of the cause of my neighbor's satellite system trouble, as in his mind he will always blame my antenna. Of course Direct TV blaming me initially for the problem did not help!

Thanks

Steve K7QHU

I realize you may have heard this before, but when I first heard it, it didn't sink in quitefar enough. So, I'll attempt to make it come thru a little clearer. Hopefully Your better about this than I was.

When you tune up, one of the steps is to set the ALC control. Now I was loading to long at first and second I'd let the needle wander up as I was adjusting the output. Soon I realized that it was harder to set the ALC and it's output was not as good. Before long the drive was gone and it was time to replace the tube again. Another $9 and open the cabinet again and wait for another tube to come in the mail. That got old.

Eventually, I learned to load right and keep the tune-up as short as possible and as inexpensive as I could. Oh, I'm alot better at it now. I archived my settings so I know where everthing is set before I apply the low-power.

I hope this helps you too.

Max Harelik <mharelik@...> wrote:
Since there's really no such thing as a "new" 12BY7 anymore, I'd suggest trying another tube first, before you start digging around in the radio's innards. Occam's razor generally applies; i.e., the simplest, most logical solution usually prevails. (I've got a TS-440 locked in diagnostic mode, but so, far, I haven't found a simple, logical solution for that problem. Not SMT inside, but close.) GL.

Never, ever, admit your rig and/or the antenna might be at fault unless you know for certain. You've left the door open for him to point a finger at you every time he develops a TV issue regardless to what the issue is. Likewise, a telephone interference issue, the stove is now not working right, the clocks aren't keeping correct time anymore, etc., his finger will be pointing at you or your antenna.

This is one of the reasons why as an apartment dweller, I try to keep my antennas stealth or low observable. I've run into too may people, who in spite of what you tell them about the poor sheilding on their junky consumer electronics, or whom you point out that you they are using cable TV (that if it's shielded decently shouldn't pick you up), "just know that you're at fault", even if you're not operating at the time.

When I was at the Univ. of WI in the 80s, operating W9YT's TS-830s, we used to have issues with a physics lab, that was doing cryogenic superconducter experiments in the same building out club station was in. They "just knew" that were were causing the noise they saw in their data readouts. It turned out that there were several things that made this claim total nonsense:

1. At most of the times in question, our club station wasn't even on-the-air.
2. Examination of the cables they used from their instruments, showed that they weren't even cables, they were twisted pairs. Some of them were over 30 feet long. We tried explaining to them (some of our members were Electrical Engineering students), that this was part of the problem. But Noooooooo, being PHd students that hey just knew that a "twisted pair was supposed to be noise cancelling." We said that was only the case in theory (and espcially not for that long of a twisted pair length). We even showed tham that they were picking up broadcast stations over the twisted pairs. But you know, they were the PHds, we were just dumb undergrads. Even after the little show & tell, we would get phone calls from the cryo lab asking us if we were operating, whenever they were picking up noise in their instruments. The tone of their voices pretty much said that they thought we were at fault.

When it comes to electronics, and especially RF applications, the average person is totally clueless. But they "just know" it's your fault.

73,
Ellen - AF9J

You'll need to start keeping a station log with accurate times of your operation since you've admitted guilt by lowering the antenna. You should put it back to full height as soon as possible and leave it there. If your neighbor starts complaining about interference, ask for the time and date, then pull out your log while he's there and compare notes. If you are causing interference, a little time grounding his equipment will eliminate a lot of complaints. If you aren't interfering, it's vital to have a station log to prove it. We've been having strange electrical problems for the past couple of years. A couple of weeks ago the lights started dimming to about half brightness occasionally. The power company sent someone out who diagnosed a problem with the line from the pole to the house. They replaced the line and all of the problems went away. Helping your neighbor diagnose the problem will reduce a lot of tension.

Reuben I realized that the postings were not originals but but in at least they could be found in the archives. It could be one of us looking for that info for our 830s that have one. My point was to make sure that a thank you went out for something like that could be a little harder to find.

It's like I explained to the comcast installer today, these radios are hard to find parts for and hard to find someone to repair them. The looks on the face of that man when he entered my staion was a good feeling for me. He asked questions and I answered them well. Then he got right to work and I tuned up the new crystal radio I built.

Ruben Echevarria <ka2hhb_2000@yahoo.com> wrote:
Hello John, just wanted to let the group know that I was not the original poster
of this article. It was VK5KYO along with N9WB. Give credit where credit is due.
So I take no credit for the tech. I did notice recently that there were a few postings
that I felt were related to this problem so I took the liberty of reposting.
Only addition was the last few lines which were mine from my own experience. And
that was the replacement of C71 as well.

Steve
I have Direct TV.. I have had to reset the box about three times or four in the last year, its a computer and sometimes rebooting is needed. I am also a ham , there is no way that your antenna will cause the problem as described. Good luck, I understand that you are trying to work this out with your neighbor and it is difficult to explain electronics with someone who is not aware of the facts but good luck..

All,

Thanks for all the replies regarding the possibility of my antenna interfering with my neighbors Direct TV. This evening I went over to my neighbor and suggested he power down his cable box, unplug it, then plug it back in. He grumbled a little bit about waiting for the technician, but then said they wouldn't be out for a week, so decided to give it a try. Well, when the cable box was plugged back in and powered up, everything was fine and he was back in business. Did he thank me.... not really. He said in three years he had never had to reset the system and insisted that my antenna was the problem. Oh well... But on a positive note, I told him I was going to put the antenna back up at half the height and see if it caused any problems and then if it did not, I would continue to raise the height a little everyday until it was back to the maximum height. I assured him I would immediately take it back down if any problems occurred. He agreed that that was reasonable, so we shall see.

Thanks again to all that responded and thanks to the moderators for letting this slightly off topic thread exist. If no one objects I will post in a week or so just to let everyone know how this story ends.

Steve,

Your incident only show the arrogance that some people have when it comes to amateur radio operators. You could put up an antenna and not transmit on it at all and I bet you would still get blamed for something. As soon as the neighbors see the antenna and they have problems with their TV reception it's natural to blame the ham. First of all, a wire antenna cannot block a satellite signal, unles of course your antenna wire is 3 feet in diameter and it runs right through his dishs line of sight. If the satellite rep told me that, I'd tell him to go back to school and learn something.
As far as your neighbor is concerned, if your antenna isn't over his property line and he thinks your antenna is causing the problems, I'd let him move his dish. It appears that he is already blaming you so let him move his antenna. My R7 vertical is within 20 feet of my neighbors dish and he tells me he has no problems at all. Ham frequencies and satellite frequencies are so far apart in the spectrum, you shouldn't be causing any interference at all. Unless he bought his receiver at the dollar store!

Good luck,

Max VE3TMT

I think all those boxes, Directv and Dish have to be reset now and then. It happens to mine (Dish) and did the same thing when I had Directv.

I never experience any interference from my 530S or other rigs. I sure upset my weather station and atomic clock though. Anytime I key up the clock blinks for a few hours and then settles down. I think it monitors the 10 meg signal??

This is also true of some cable boxes too. One time got a bang on the floor to "get off the air"; TV picture went dark in the middle of one of her favorite shows. Problem was, I wasn't on the air. Came up, reset the box, and picture and sound returned.

Tongue-in cheek - "It can't ever be the ham's fault" cause we're licensed by a Federal Government Agency and only need to answer to them.

Sometimes mentioning that your licensed by a Federal Government Agency will make people take a step back especially if they have no clue what they are talking about. In the 47 years of hamming, in two locations, I've learned never to diddle with any of the neighbor's stuff (TV's, stereo's, telephone's, etc.) if they are experiencing problems, noise, lines on the TV, grinding sounds, etc. Refer them back to the manufacturer of the product, suggest possible filters, but don't volunteer to look at it, touch it, etc. Your asking for trouble.

Anyone in VK got some TS520 bits they can sell me - NLA from Kenwood.
Need (or rather, want)

VFO gear mechanism pn D40-0099-15
Xtal for 28.5Mhz band freq 37.395Mhz pn L77-0146-15

The xtal is just dead.

The VFO feels like your opening a can of baked beans with a blunt can opener when turning the knob - as far as I can tell, the ball bearings have eroded the brass shaft so they are just plain sloppy.

The VFO - one possibility is to machine a new shaft, but my metalworking skills aint up to that yet! - the other is get oversize bearings and ream out the housings on the shaft - again, it would be a PITA and I dont want to do it lest I stuff it up completely - it does work at the moment, it just feels bloody horrible!

BTW - whats the recommended grade of grease/oil in these things - the original grease had long since balled, so there was corrosion on the steel bearing retainers as well as the erosion of the carrier shaft.

Or can anyone suggest a repair method on these things? (please????)

Andrew VK3BFA.

G'day Andrew

I think I may have the crystal and a complete VFO minus the frequency readout plate.

I have to check if I still have them.

From memory I bought the vfo a couple of years ago from the states.

I will let you know later tonight.

Regards
Anthony

Hi Pete,

Have you tried headphones?

I have an 830s but I notice the audio sounds cleaner and smoother if I back the RF gain down. On an S9 signal, I'll back it down until the S-meter hovers at S9+20. Background noise drops, the signal becomes smooth and clear.

Mind you, my rig, even with the RF gain full on, still sounds very good so I don't think I'm seeing the problem you are (which does indeed sound like AGC not doing it's job.

73!

9521. 830s ALC problems - help?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-09-19 11:59:55 UTC
From: Darwin, Keith
Topic: 9521 Message: 9521

Hey folks,

My 830s has developed an intermittent problem with the ALC on TX. During tune-up things will be going just fine. The all the sudden no ALC, no plate current, no output. Moving to the CW position and maxing the CAR control I'll get 20 or 30 watts out tops.

I did some exploring and found the problem seems tied to L29 on the IF board (Or was it L28 - It's the one closed to the VFO). If I tap the inductor or adjust it my rig suddenly jumps to life (I get lots of ALC and lots of output. Figuring the control was dirty, I spun it back and forth several times. Things settled down and the rig worked predictably for a bit. Then the problem returned.

I went back into the rig and reseated the cables near L29. No change. Figuring L29 was dirty, I sprayed it (lightly) with DeOxIt. Spun it back and forth then peaked the signal. That seemed to do it.

BUT

The rig puts out 25 watts with the CAR control at minimum. It used to turn down to less than 5. Now 25 is the min. And the intermittent problem came back. What's up with that? Did the DeOxIt provide some leakage paths around parts of the circuit or something?

I'm thinking I should just replace L29. Is this a part that is available? From Mouser? From whom? Or should I be looking for a different cause to the problem?

- Keith KD1E -

An excellent collection of TS-830S hints and solutions to problems was collected on a web site several years ago. Although directed to the 830, many of the solutions to problems probably could also be directed to some of the similar models. Schematic notations(R2, C45, L21, etc, etc.) would probably have to be adjusted to conform to the model you have but there are tons of helpful hints and solutions to a wide variety of problems including several that were mentioned here recently.
Best thing is to download the PDF file:

Ok Will try these changes. On CW its about the same effect. Maybe it is just a case of keeping the RF gain backed off. Makes a bif difference. S meter works as it should . AGc is on slow so thats OK. Will try the caps and see what happens! Many thanks all
Pete

Subject: Re: [TS-520_820_530_830] TS530S Audio Distortion..Any advice please?

An excellent collection of TS-830S hints and solutions to problems was collected
on a web site several years ago. Although directed to the 830, many of the
solutions to problems probably could also be directed to some of the similar
models. Schematic notations(R2, C45, L21, etc, etc.) would probably have to be
adjusted to conform to the model you have but there are tons of helpful hints
and solutions to a wide variety of problems including several that were
mentioned here recently. Best thing is to download the PDF file:

9533. The TS830S Survival Guide

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-09-19 20:02:03 UTC
From: Ruben Echevarria
Topic: 9533 Message: 9533

http://www.geocities.com/om6523/

This link takes you to the latest version of the guide.......
And this is what the page says:

This page is dedicated to all TS-830 users out there...
Ham radio equipment with solid state technology is "state of the art", but many of the older rigs are still in use today. These ancient machines can be purchased on the used market for low prices and some are known to be very reliable, among them the TS-830. This rig produced by Trio/Kenwood in the 1980's is a hybrid transceiver containing semiconductors and integrated circuitry as well as vacuum tubes in the final stage.
Although a lot of material about the TS-830 is available on the web, there's no comprehensive collection available (as far as I know). So I'll present here the stuff I collected while searching for problem fixes for my TS-830.
The basic idea was to produce a printable manual-like guide, ready for making additions and modifications. So the file format had to be a common used one, with good compression of the included images and with hypertext capabilities. I chose the Microsoft Word 2000 format because it fulfils these requirements more or less and is supposed to become some kind of standard (at least for the next few years). In contrast, PDF seems to be not a good choice for the sake of further processing of the text. Nevertheless a PDF-version is also available...
Download 830book1.doc (466 KByte, Microsoft Word 2000 required)
Download 830book1.pdf (1544 KByte, Adobe Acrobat Reader required)
Please feel free to distribute this file over the net. If You make changes to it, please mail a copy of Your additions.

9534. Re: [TS-520_820_530_830] 830s ALC problems - help?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-09-19 22:14:51 UTC
From: n9wb
Topic: 9521 Message: 9534

Keith:

Remove the IF board and scan the foil side for bad solder connections. With a low wattage iron, re-solder any connections that are suspect. Also re-solder the connections from the connectors to the board. Ruben just had a similar problem and this was the fix. Look carefully around the coil in question and re-solder the associated joints. Be very careful not to get solder bridges and if you do remove it at once before you proceed or you will forget where it was.

Probably when you touch the coil, it is ever so slightly flexing the board. After replacing the board, be sure all connectors are lined up properly and check all the screws that mount all of the boards for tightness.

Subject: [TS-520_820_530_830] 830s ALC problems - help?

Hey folks,

My 830s has developed an intermittent problem with the ALC on TX. During tune-up things will be going just fine. The all the sudden no ALC, no plate current, no output. Moving to the CW position and maxing the CAR control I'll get 20 or 30 watts out tops.

I did some exploring and found the problem seems tied to L29 on the IF board (Or was it L28 - It's the one closed to the VFO). If I tap the inductor or adjust it my rig suddenly jumps to life (I get lots of ALC and lots of output. Figuring the control was dirty, I spun it back and forth several times. Things settled down and the rig worked predictably for a bit. Then the problem returned.

I went back into the rig and reseated the cables near L29. No change. Figuring L29 was dirty, I sprayed it (lightly) with DeOxIt. Spun it back and forth then peaked the signal. That seemed to do it.

BUT

The rig puts out 25 watts with the CAR control at minimum. It used to turn down to less than 5. Now 25 is the min. And the intermittent problem came back. What's up with that? Did the DeOxIt provide some leakage paths around parts of the circuit or something?

I'm thinking I should just replace L29. Is this a part that is available? From Mouser? From whom? Or should I be looking for a different cause to the problem?

- Keith KD1E -

Keith, I'm betting you have a bad solder joint on the Connector next
to L29 I would remove the If board enough to flip it over and check
very closely around that connector. It could even be a cold solder
joint on the L29 itself, but most likely it is one of the connector pins.

I had that problem on an 820 once. turned out there were two resistors
on the AF board that had gone WAY up in value. Ohmed them out,
replaced them and problem was solved.
Don't know if that'll help you in any way with your 530, but it's a hint.

I've got the PDF version stored and when the cold weather is here some time soon I'll make a paper copy of it for myself.

Ruben Echevarria <ka2hhb_2000@...> wrote:
http://www.geocities.com/om6523/

This link takes you to the latest version of the guide.....
And this is what the page says:

This page is dedicated to all TS-830 users out there...
Ham radio equipment with solid state technology is "state of the art", but many of the older rigs are still in use today. These ancient machines can be purchased on the used market for low prices and some are known to be very reliable, among them the TS-830. This rig produced by Trio/Kenwood in the 1980's is a hybrid transceiver containing semiconductors and integrated circuitry as well as vacuum tubes in the final stage.
Although a lot of material about the TS-830 is available on the web, there's no comprehensive collection available (as far as I know). So I'll present here the stuff I collected while searching for problem fixes for my TS-830.
The basic idea was to produce a printable manual-like guide, ready for making additions and modifications. So the file format had to be a common used one, with good compression of the included images and with hypertext capabilities. I chose the Microsoft Word 2000 format because it fulfils these requirements more or less and is supposed to become some kind of standard (at least for the next few years). In contrast, PDF seems to be not a good choice for the sake of further processing of the text. Nevertheless a PDF-version is also available...
Download 830book1.doc (466 KByte, Microsoft Word 2000 required)
Download 830book1.pdf (1544 KByte, Adobe Acrobat Reader required)
Please feel free to distribute this file over the net. If You make changes to it, please mail a copy of Your additions.
Last update: November 13th 2002

well actually some of these things are found right around the web. For example the Owners comments are on E-Ham. Also the mods are found on DK among other sources. This person Olaf Rettkowski callsign DL9AI actually got it in one place. the version 1.2 is dated 3 DEC 2002 at almost the top on a flip from the cover. his perface at the bottom states his terms to propagate and improve it's content, thus it is dated as such from Halle, Germany June 25th, 2002. Until I found this group a couple of months ago this and my owners manual were all I had for information I could reference. I don't even have the service manual at this time. The organization of all these archives (which I'm including this yahoo group) is what there is for us out here.

Beyond the possibility of the radios failing into parts rigs and these compiled data we have left beyond those left that know these machines well enough to deal with thier issues. Even some of our parts are becoming scarce. Has anyone of us thought of what happens with parts and repair now with the changes against lead solder. Electronics is now going lead free.

I must admit we have challenges ahead of us.

9544. LED replacement of bulbs TS520

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-09-20 05:15:25 UTC
From: vk3bfa
Topic: 9544 Message: 9544

Hi all - have posted a picture of the white LED conversion on my junker TS520. Its a pain to constantly replace incandescent bulbs, particularly the ones in front of the VFO. The 12vac from the original supply line is half wave rectified, filtered (yellow cap in picture) and then appplied to a LM317 set up as a constant current regulator. I set current to 15ma, gives nice level of illumination. The LEDs used were the cheapest in the shop, 99c, rated at 2,000mcd. No point in going brighter. The LEDS are all in series to provide the same current flow through each one, and thus the same brightness in each one. The original tagstrip on the bottom LHS of the meter was kept, usud as a tie point. The regulator was built on a scrap of PCB, scored with a hacksaw to provide pads. A small hole drilled in the corner of the borad enabled the assembly to be mounted on the top RHS meter support bolt head.

Worth the effort I hope......a nice brainless activity while pondering the inexplicable and bizarre faults in these lovely old radios...

Andrew VK3BFA.

Pete,

As someone involved with the conversion of electronic products to lead-free soldering, I can provide some advice based on the European Union Directive, which is driving the world-wide move to lead-free. In the US you do not have any restrictions at the present time, as far as I am aware, but many States, particularly CA, are looking at legislation in this area. To give you some idea of what is happening over this side of the Atlantic, and as a foretaste of things to come in the US......

Home construction is exempt from the Directive Also, maintaining equipment sold before 1 July 2006 is exempt because it prolongs the life of equipment and so keeps it out of land-fill. So there are no restrictions that affect the maintenance of Kenwood hybrid rigs.

I am sure that lead-based solder will be available for a long time yet - in the EU there are exemptions for the military and, at the present time, for medical and measuring equipment and for equipment covered by other Directives such as electronics in vehicles. However, if you are concerned about the availablity of leaded solder, then do as I have done - buy a life-time supply of 60/40 solder!

Richard G3OTK

I have uploaded the Survival Guide to the files section. It is in rich text format, so if you have WordPad (included in Windows) on your computer it should be fine. I did delete the photos of the TS820 monitor circuit which I posted long ago. Not sure if this increased the available space to any great extent but the Survival Guide is now in the files section.

Thanks Gordon & Walt!

I've been thinking my next step would be checking / redoing the solder joints in the region around L29 and the neighboring connectors so you're suggestions are right in line with my plans.

Of course last night the rig worked 100%. Had a QSO with a guy nr Chicago. We chatted on CW, he on paddles, me zipping along with my straight key, for over 30 minutes an my rig never hiccupped once. I'm sure the issue will return and when it does, out comes that IF board.

I'm still puzzled about the min power output. It used to be 5 watts or less. Now, I get 25 watts with the CAR level at min. Hmmm.

I noticed that there are some other files in the file section that could be optimized using Acrobat Professional to reduce their size by at least a third or more very easily. The TS-830 Instruction manual and the Service manuals are good examples of that. I tested it out on the 830 Instruction manual and I dropped it's file size from 4.7 megs to 2.9 megs in about 5 seconds. The TS-830S servive manual can be reduced from over 10 megs to about 3.9 megs also. That would free up a bunch of space.

Hi Pete,
first step is to see if its from the audio board or further back -
connect an audio amp (I used the "aux" input of the shack stereo) to
the input of the TS520 amp. See if the problem dissapears - then its
the audio board.

The basis of ANY fault finding is systemic elimination of causes - you
will eventually narrow it down to the "faulty" component - but first
step is to narrow it down to the faulty board/subsystem.

For what its worth, oe of my TS520's had the same - if you have a CRO,
stick it across the speaker - look for narrow, hig amplitude spikes.
Mine cured by tightening down bolts on output transistors - dont know
if the TS530 uses the same board or not.....

Let us know how you go.

73 de VK3BFA Andrew.

PS - I cant type, and my spelling is crap. Try to correct as I go, but
sometimes miss a few things. Sorry to the group. Its not a reflection
of my moral character, or an excuse to start a flame war.

Andrew,
It is the help and advice that people here are looking for.
We are not here about the spelling. We all do the best we can, but we
all make typos.
Don't worry about it.
It's the Knowledge that you share that is important.
It's good advice to isolate where the distortion is from, then trace
it down.

Topic: 9558 Message: 9558

Hi everyone. By the way; this is a great group. I'm wondering about a small problem I'm having with my 820. Sometimes when operating SSB (no vox) the rig delays befor returning to the receive position. I have the VOX turned off and the delay is turned all the way down. It doesn't happen all the time but often enough to cause me to be a little concerned. Anyone else ever had this sympton?

Jack - KF4YIO

Topic: 9560 Message: 9560

Recall, I had 2 issues with my 830s. Intermittent TX and min CW output of 25 watts.

The intermittent ALC and intermittent TX was solved by removing the IF board and reflowing solder joints around the intermittent L29. Now it's as solid as a rock.

The 2nd problem was solved by balancing the carrier on SSB. It was set for LSB but too much carrier was leaking through in USB. Once I got the rig set to subdue the carrier equally in both modes, the min CW output dropped to 0.

Just for fun, I replaced all 16 of the screws that hold the case on the chasis with new SS machine screws. They work nice and look good.

This 830s is really starting to shape up to be be a nice rig!

Of course, while I had it apart I checked the plastic coupler on the bandswitch, inside the RF cage. Yep, it's cracked but is still working. Time to get a new one.

73 all!

Subject: RE: [TS-520_820_530_830] Re: 830s ALC problems - help?

Thanks Gordon & Walt!

I've been thinking my next step would be checking / redoing the solder joints in the region around L29 and the neighboring connectors so you're suggestions are right in line with my plans.

Of course last night the rig worked 100%. Had a QSO with a guy nr Chicago. We chatted on CW, he on paddles, me zipping along with my straight key, for over 30 minutes an my rig never hiccupped once. I'm sure the issue will return and when it does, out comes that IF board.

I'm still puzzled about the min power output. It used to be 5 watts or less. Now, I get 25 watts with the CAR level at min. Hmmm.

73!

I was able to take the TS-830 Manuals on our file page and shrink them considerably in size by using Adobe Acrobat writer. So now instead of only having 1% of file space available, we now have 40% available.

Hi Keith, When you want to change the coupler I would suggest the couplers from K4EAA. I put one of these in my TS-830S and it works fantastic. Go to his web site and he has pictures of them for you to view. Congratulations on getting your rig working.

Those couplers from K4EAA work great, and are easy to put in. Only problem was I didn't pay attention and got the shafts of either 1/4 or 1/2 turn. Took some doing to get it figured out, so watch how it comes off.

Hi Max (& the group).

The sizes were metric. 4mm x 0.7. Length measures 7/32" which works out to 5.5mm. I bet they're called 6 mm long.

I got them for $0.40 ea (ouch) at my local small town hardware chain store - Aubuchons Hardware. Home Despot didn't have any that I could find.

Hi Keith,

I had the same problem balancing my carrier with one of my 830S' and replaced the cheap 1K60 diodes in the balanced modulator with Shottkey 1N5711 diodes. I also replaced the same type diodes in the product detector with the 5711's and dramatically reduced the annoying background noise. The receiver is as quiet as my Icom 765 now.

Hi Rick by any chance did you or can you put together a detailed paper on your mods? It would go great with the rest of the data we already have on rigs. Include any do's and don'ts. I'm sure there are quite a few of us that may be interested in your mods.

And Keith nice to hear you have your ALC problem under control. Now that my number 1 TS830S is still apart I may just go ahead and reflow each and every solder point on the IF board. I only did a few and it brought the RX back up. But I still can't get any decent ALC. The RF board is out right now and am waiting for some caps.

Hi Ruben,

The Shottkey diode mods are explained and outlined nicely by Rich Measures, AG6K, in his 'Circuit Improvements and Maintenance Procedures for the 830S' and is in the 'Survival Guide' listed in the files section.
It really is an amazing improvement. Gordon, N6WK, has some of the 1N5711 diodes but I don't know if he has had a chance to swap his out yet.

I have a hard time finding things at Home Despot and I used to work there.

"Darwin, Keith" <keith.darwin@...> wrote: Hi Max (& the group).

The sizes were metric. 4mm x 0.7. Length measures 7/32" which works out to 5.5mm. I bet they're called 6 mm long.

I got them for $0.40 ea (ouch) at my local small town hardware chain store - Aubuchons Hardware. Home Despot didn't have any that I could find.

Kieth, you know where to get one, right?

"Darwin, Keith" <keith.darwin@...> wrote: Recall, I had 2 issues with my 830s. Intermittent TX and min CW output of 25 watts.

The intermittent ALC and intermittent TX was solved by removing the IF board and reflowing solder joints around the intermittent L29. Now it's as solid as a rock.

The 2nd problem was solved by balancing the carrier on SSB. It was set for LSB but too much carrier was leaking through in USB. Once I got the rig set to subdue the carrier equally in both modes, the min CW output dropped to 0.

Just for fun, I replaced all 16 of the screws that hold the case on the chasis with new SS machine screws. They work nice and look good.

This 830s is really starting to shape up to be be a nice rig!

Of course, while I had it apart I checked the plastic coupler on the bandswitch, inside the RF cage. Yep, it's cracked but is still working. Time to get a new one.

73 all!

Subject: RE: [TS-520_820_530_830] Re: 830s ALC problems - help?

Thanks Gordon & Walt!

I've been thinking my next step would be checking / redoing the solder joints in the region around L29 and the neighboring connectors so you're suggestions are right in line with my plans.

Of course last night the rig worked 100%. Had a QSO with a guy nr Chicago. We chatted on CW, he on paddles, me zipping along with my straight key, for over 30 minutes an my rig never hiccupped once. I'm sure the issue will return and when it does, out comes that IF board.

I'm still puzzled about the min power output. It used to be 5 watts or less. Now, I get 25 watts with the CAR level at min. Hmmm.

73!

Rick,

Since you put out the info on 1N5711's a few weeks ago, I have replaced the 1N60's in the product detectors and balanced modulators in 3 radios - One TS-530S, and two TS-830S's. I have no technical comparisons for you, but I have been very pleased with how the radios sound after the mods. In one of the 830's, I added the 100 ohm resistor (per AG6K) and the results came out fine even though I was not experiencing any distortion problems before. It was fun figuring out how to adjust L19 and L20 to achieve USB/LSB balance at 600mv, but I finally got there. Thanks for encouraging us with these radios.

I have posted some pics of the gear with its new paint job. The color used is Gunmetal, which is just slightly darker than the TS850 color. I think it turned out quite well. I also used new hardware on the 830. Just my luck the S-meter bulb burnt out when I was assembling so I picked up a 12V replacement at Radio Shack. I see they also have bright white LED's there, and if anyone can tell me what resistor value I would need to make it work for the S-meter it would be appreciated. Thought you might be interested to see the 830 in its new skin. They're all in the VE3TMT folder.

Hi Bill,

I don't have any real way to do technical comparisons here either. The receivers just have a much smoother sound. I also used to have at least S4 or S5 noise level on the lower bands and I am listening to a Swiss station on 40 meters working the U.S. east coast right now (04:30 UTC) and my noise level is bouncing between S1 and S3...Very quiet.

Walt,

The name on the can is Dupli Color Truck, Van and SUV paint. I'm sure you can also get it at Home Depot or Lowe's. I have to admit after much debate whether to paint or not I'm glad I did. It reallt gives the gear a modern look. I still have to pick up the paint for the front panel as I have a few nicks on it. I am going to pick up the bright white LED at Radi Shack today and swap it out for the meter bulb. The 12V lamp I put in isn't as bright as the original, which I though was a bit dim to begin with.

Here's a option for painting our radios that will last forever...
It's called powder coating....It's almost like electroplating but it's done with paint powder. The piece is charged electrically and then color is sprayed dry. Then it's heated to a certain temp and it hardens to a very hard finish. Different textures can also be duplicated. Piece becomes scratch proof and will forever look like new. This process is used by many custom motorcycle builders and racer car builders as well. Try " Google-ing" powder coating and see what you get. As far as removing paint from our panels I would use a chemical remover and not a sand blaster, the blaster in my opinion would distort the thin sheetmetal.

Hey Mike, that was me. Thanks very much. I am going with a bright white LED behind the meter. I will use two 1K resisitors in parallel. The resultant 500 ohms is a bit high (target is 430) but shouldn't pose a problem with the LED. My meter bulb burnt out so I put a Radio Shack 12V light in there but it is too dim. Not like the TS520 I used to have the meter on those is perfect. I have been looking at the meter in the AT230 to see if I could put an LED in there, but by shingin a light on the back of the meter I don't see how any light can penetrate to show out the front. The meters on my old FT107 line all had small bulbs mounted in the meter face itself below the coil. Not much room in the AT230 for that.

9593. RE: [TS-520_820_530_830] TS830S No Drive on 30m -- Solution!

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-09-24 20:21:41 UTC
From: Ron Hauser
Topic: 7936 Message: 9593

Success! It is always the too-easy stuff that one misses.

Summary: No drive on 30m, no power output. Carrier is heard on an adjacent receiver in transmit, and signals are heard when listening. Drive control peaks the received signal. Tracing with an RF probe from the driver tube over to the final board, there is a signal there but not the level that is present on other bands. The not-right level is the same all the way to the final board. Bandswitch checks out ok.

It turns out that the tuning slug for the drive coil on 30m was turned way way out (L26 on the RF board). Adjusting the drive coil according to the operator manual brought the drive up and I now have full 100w out. One wonders _why_ the coil was so far out of adjustment, perhaps the capacitor C35 has gone out of tolerance... Or something. The other coils are not out that far. I'll have to watch it for a bit, but I am putting it back on the air and I'll see if I have issues cropping back up.

Thanks to this group for the coaching!

Subject: RE: [TS-520_820_530_830] TS830S No Drive on 30m

Continuation of my slow troubleshooting, I got to spend some more time on the workbench this weekend.

Walt asked if I had a carrier that I could hear on a nearby receiver when in transmit: Yes. I took an SWL radio and listened, when transmitting in Tune position I can hear the carrier on 30m (also on 20m and 40m).

Clif suggested no load, so look further downstream, possibly bandswitch. I put my RF probe on the connection point where the drive signal wire goes into the final board. When switching to transmit in tune position:

20m peaks up to ~25v then settles down to ~3v
40m peaks up to ~25v then settles down to ~3v
30m rises smoothly to 5v with no peak.

What I want to do now is to see if the drive signal is actually getting to the tube, which I think would verify that the bandswitch is the problem.

However, I am being very very cautious poking at the bottom of the finals because of the high voltage. After careful scrutiny of the board drawing and schematic I think I am expecting to see the drive signal on pin 5 of the final socket. Can anyone verify before I poke a probe into a high voltage circuit?

Thanks!

Subject: [TS-520_820_530_830] TS830S No Drive on 30m

Greetings Kenwood Gurus. About two months ago I was working along with Joe Sloss K7MKS, Bill Schurlock KG5CW, and Joan from Down Under VK5KYO. Bill helped get me set up with a VTVM, I eventually got an RF probe made, and finally I have done some testing.

The problem:

I have a TS830S that I got from the previous owner about a year ago. There is no drive at all on 30m, no matter the position of the drive control knob (also no RF out). All other bands produce drive (and I've had QSOs, seem to be working fine). It receives just fine, I've listened to WWV and various CW and digital QSOs on 30m. I have verified that the WARC bands have been enabled by snipping wire #1 on connector #6 according to the manual. I've tried lots of wiggling of the bandswitch, also poking carefully at the bandswitch contacts, also tested resistance on the bandswitch contacts which are outside the finals cage. No wiggling ever gives a twitch of drive, and all the contacts outside the finals cage show continuity. On receive the drive control does peak the signal.

Based on Joan's problem with a missing band, I tested C74 and L36 on the RF board. I believe that both these components are ok -- L36 showed right at the 4 ohms level Joan was looking for, and C74 is not shorted and doesn't look burned or anything.

I then took Joe's advice and attempted to measure the RF voltage on the grid of the driver tube. I believe this is a promising path, but I must first verify that I measured on the _correct_ pin. So. I have the radio sitting right side up on the bench with the covers off, the RF board is exposed and the driver tube is right there in the middle. I'm looking down at the tube/socket from above -- actually I am also looking at the board layout diagram in the service manual, which is the same orientation of course. I'm a little fuzzy on the "proper" numbering order of the pins. But anyway in this orientation the gap with no pins is at 9 oclock. There is a pin at 8 oclock, one at 7 oclock, one at five oclock. After staring at the diagrams and thinking about it for a while, I believe the pin at 7 oclock is the one

that I want. So I put the rf probe on that pin and with the rig in tune, I switched to send and indeed I got RF.

Question #1. Am I on the right pin (or if not what am I measuring!?!)

Question #2. If I am on the right pin, I have an interesting result, because the RF voltage is not the same. At 14110 kHz I got 1.5 V. At 7110 kHz I got 1.4 V. But on 10110 kHz I got 5.2 V. Hm!!!

Subject: [TS-520_820_530_830] TS830S No Drive on 30m

Hi Joe, understood. I had come to a similar conclusion this afternoon after our previous emails; a VTVM would be very handy right now. I'm going to proceed as recommended, I will build an RF probe to use with my DMM. I will also keep an eye out on Ebay and the other sites for a VTVM which is what I really need. Using whichever of those I get hold of first I'll start tracing as you recommended.

To restate the problem for future reference: I have a TS830S that I got from the previous owner about 8 months ago. There is no drive at all on 30m. All other bands produce drive (and I've had QSOs, seem to be working fine). It receives just fine, I've listened to WWV and various CW and digital QSOs on 30m. I have verified that the WARC bands have been enabled by snipping wire #1 on connector #6 according to the manual. I've tried lots of wiggling of the bandswitch, also poking carefully at the bandswitch contacts, also tested resistance on the bandswitch contacts which are outside the finals cage. No wiggling ever gives a twitch of drive, and all the contacts outside the finals cage show continuity. On receive the drive control does peak the signal. Therefore my current thinking is to look for trouble somewhere besides the bandswitch, my best thought being to check C74 and L36 on the RF board as noted by Joan VK5KYO.

I've changed the subject to more accurately reflect this issue, so that it will be easier to find in the future. I will have some time to work on the radio again tomorrow, then I'm out of town for vacation and for work for a few weeks. I'm archiving all these conversations so that I'll be able to come back to them.

I appreciate your coaching.

Subject: Re: [TS-520_820_530_830] TS830S low power

Ron: There are several Heath RF probes on ebay that could be adapted to use

with your DMM. Handiest thing in the world when you need one.

The fact that your DRIVE control peaks a received signal tells me that the
BS and associated circuits on 30m may be OK.

I was going to ask you to measure RF voltage at the grid of the driver tube.

Do this on 40 and 20 when you are in the TUNE position. Then check 30m.

If you have about the same RF voltage then the 30m circuits BEFORE the grid

are working correctly. If the 30m voltage is lower or non-existant then
your problem is before the grid of the driver tube.

Before I go too far you might refresh my memory as to the problem you are
having. I think I've deleted some of your earlier comments on what was
wrong and what does what.

No drive on 30m, no power output.

Somone might have slipped a different crystal in it and tried retuning it for CB? Just a guess.

I just wanted to post this message to the out group here.
After cleaning my RF board before replacing a few components, using
a magnifying glass I went over every single solder point on the foil side
and to my surprise I found several components that were loose, so I
proceeded to reflow the points. Although the points looked good and
strong they were not. Don't take anything for granted even though it they
may look good and strong. Once I'm done with this board I'll be doing the
same to the IF board. Although I previously did do the IF board, the solder
points on the connectors and it did cure part of my RX problem and the ALC
came up a bit. I feel the prudent thing to do is the complete board.
Well I'll keep everyone posted.......KA2HHB

The bandswitch can be left in place, just place it in the #10 spot pull the cover off the cage and
lossen the setscrew on the coupler. Slide the shaft out enough to clear the cage. While there take
a good look at the plastic coupler and check it for cracks. If cracked replace it with one from K4EAA.
Should be about 8 screws holding the board to the chassis. Desolder the white wire from the feedthrough
coming from the cage. You'll also come across a blue wire soldered to a pad underneath the board, desolder
as well. Use a marker and circle the pad that the blue wire was attached to. Using a fine tip felt marker
number each pushin connector 1 thru 10 one at a time as you pull them out. What I did was draw a sketch
of the board showing the connectors and numbered each connector accordingly. So all I have to do is refer
back to my sketch and just place each connector back in the corresponding pin strip. and of course resolder
the white and blue wires. By the way I did pull out the "LOAD" shaft out completely. I use alcohol to clean the board first then checked it all out. Afterwards I reflowed all the solder points.

I have a 520SE I bought a couple weeks ago. Good looking old radio, clean and free of crud on the chassis. Tuned and loaded it up last evening on 75 meters, the output was low, I switched it to CW position, repeaked the drive, dipped the plate, and saw the output gradually come up. Within a second or two it popped and went dark. There was a zzzttttt noise under the chassis. (How do you like that for a description) I haven't went any farther, suspect it took the fuse, and some resistors under the finals went south. I hope thats all it was. Anyway, I'll give it a look this evening. Now I have a project radio. As long as the 530S works I'm in no hurry.

9608. RE: [TS-520_820_530_830] TS830S No Drive on 30m -- Solution!

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-09-26 02:31:00 UTC
From: John Harp
Topic: 7936 Message: 9608

nice work. I had the feeling that might be it.

Ron Hauser <eichmann@...> wrote: Success! It is always the too-easy stuff that one misses.

Summary: No drive on 30m, no power output. Carrier is heard on an adjacent receiver in transmit, and signals are heard when listening. Drive control peaks the received signal. Tracing with an RF probe from the driver tube over to the final board, there is a signal there but not the level that is present on other bands. The not-right level is the same all the way to the final board. Bandswitch checks out ok.

It turns out that the tuning slug for the drive coil on 30m was turned way way out (L26 on the RF board). Adjusting the drive coil according to the operator manual brought the drive up and I now have full 100w out. One wonders _why_ the coil was so far out of adjustment, perhaps the capacitor C35 has gone out of tolerance... Or something. The other coils are not out that far. I'll have to watch it for a bit, but I am putting it back on the air and I'll see if I have issues cropping back up.

Thanks to this group for the coaching!

Subject: RE: [TS-520_820_530_830] TS830S No Drive on 30m

Continuation of my slow troubleshooting, I got to spend some more time on the workbench this weekend.

Walt asked if I had a carrier that I could hear on a nearby receiver when in transmit: Yes. I took an SWL radio and listened, when transmitting in Tune position I can hear the carrier on 30m (also on 20m and 40m).

Clif suggested no load, so look further downstream, possibly bandswitch. I put my RF probe on the connection point where the drive signal wire goes into the final board. When switching to transmit in tune position:

20m peaks up to ~25v then settles down to ~3v
40m peaks up to ~25v then settles down to ~3v
30m rises smoothly to 5v with no peak.

What I want to do now is to see if the drive signal is actually getting to the tube, which I think would verify that the bandswitch is the problem. However, I am being very very cautious poking at the bottom of the finals because of the high voltage. After careful scrutiny of the board drawing and schematic I think I am expecting to see the drive signal on pin 5 of the final socket. Can anyone verify before I poke a probe into a high voltage circuit?

Thanks!

Subject: [TS-520_820_530_830] TS830S No Drive on 30m

Greetings Kenwood Gurus. About two months ago I was working along with Joe Sloss K7MKS, Bill Schurlock KG5CW, and Joan from Down Under VK5KYO. Bill helped get me set up with a VTVM, I eventually got an RF probe made, and finally I have done some testing.

The problem:

I have a TS830S that I got from the previous owner about a year ago. There is no drive at all on 30m, no matter the position of the drive control knob (also no RF out). All other bands produce drive (and I've had QSOs, seem to be working fine). It receives just fine, I've listened to WWV and various CW and digital QSOs on 30m. I have verified that the WARC bands have been enabled by snipping wire #1 on connector #6 according to the manual. I've tried lots of wiggling of the bandswitch, also poking carefully at the bandswitch contacts, also tested resistance on the bandswitch contacts which are outside the finals cage. No wiggling ever gives a twitch of drive, and all the contacts outside the finals cage show continuity. On receive the drive control does peak the signal.

Based on Joan's problem with a missing band, I tested C74 and L36 on the RF board. I believe that both these components are ok -- L36 showed right at the 4 ohms level Joan was looking for, and C74 is not shorted and doesn't look burned or anything.

I then took Joe's advice and attempted to measure the RF voltage on the grid of the driver tube. I believe this is a promising path, but I must first verify that I measured on the _correct_ pin. So. I have the radio sitting right side up on the bench with the covers off, the RF board is exposed and the driver tube is right there in the middle. I'm looking down at the tube/socket from above -- actually I am also looking at the board layout diagram in the service manual, which is the same orientation of course. I'm a little fuzzy on the "proper" numbering order of the pins. But anyway in this orientation the gap with no pins is at 9 oclock. There is a pin at 8 oclock, one at 7 oclock, one at five oclock. After staring at the diagrams

and thinking about it for a while, I believe the pin at 7 oclock is the one that I want. So I put the rf probe on that pin and with the rig in tune, I switched to send and indeed I got RF.

Question #1. Am I on the right pin (or if not what am I measuring!?!)

Question #2. If I am on the right pin, I have an interesting result, because the RF voltage is not the same. At 14110 kHz I got 1.5 V. At 7110 kHz I got 1.4 V. But on 10110 kHz I got 5.2 V. Hm!!!

Subject: [TS-520_820_530_830] TS830S No Drive on 30m

Hi Joe, understood. I had come to a similar conclusion this afternoon after our previous emails; a VTVM would be very handy right now. I'm going to proceed as recommended, I will build an RF probe to use with my DMM. I will also keep an eye out on Ebay and the other sites for a VTVM which is what I really need. Using whichever of those I get hold of first I'll start tracing as you recommended.

To restate the problem for future reference: I have a TS830S that I got from the previous owner about 8 months ago. There is no drive at all on 30m. All other bands produce drive (and I've had QSOs, seem to be working fine). It receives just fine, I've listened to WWV and various CW and digital QSOs on 30m. I have verified that the WARC bands have been enabled by snipping wire #1 on connector #6 according to the manual. I've tried lots of wiggling of the bandswitch, also poking carefully at the bandswitch contacts, also tested resistance on the bandswitch contacts which are outside the finals cage. No wiggling ever gives a twitch of drive, and all the contacts outside the finals cage show continuity. On receive the drive control does peak the signal. Therefore my current thinking is to look for trouble somewhere besides the bandswitch, my best thought being to check C74 and L36 on the RF board as noted by Joan VK5KYO.

I've changed the subject to more accurately reflect this issue, so that it will be easier to find in the future. I will have some time to work on the radio again tomorrow, then I'm out of town for vacation and for work for a few weeks. I'm archiving all these conversations so that I'll be able to come back to them.

I appreciate your coaching.

Subject: Re: [TS-520_820_530_830] TS830S low power

Ron: There are several Heath RF probes on ebay that could be adapted to use

with your DMM. Handiest thing in the world when you need one.

The fact that your DRIVE control peaks a received signal tells me that the
BS and associated circuits on 30m may be OK.

I was going to ask you to measure RF voltage at the grid of the driver tube.

Do this on 40 and 20 when you are in the TUNE position. Then check 30m.

If you have about the same RF voltage then the 30m circuits BEFORE the grid

are working correctly. If the 30m voltage is lower or non-existant then
your problem is before the grid of the driver tube.

Before I go too far you might refresh my memory as to the problem you are
having. I think I've deleted some of your earlier comments on what was
wrong and what does what.

Hey I like this idea. My SWR meter on my tuner is not bright enough. Must try that. Come to think I could do that on my UTC clock too. It'd be bright and probably would last too.

Hey Mike, that was me. Thanks very much. I am going with a bright white LED behind the meter. I will use two 1K resisitors in parallel. The resultant 500 ohms is a bit high (target is 430) but shouldn't pose a problem with the LED. My meter bulb burnt out so I put a Radio Shack 12V light in there but it is too dim. Not like the TS520 I used to have the meter on those is perfect. I have been looking at the meter in the AT230 to see if I could put an LED in there, but by shingin a light on the back of the meter I don't see how any light can penetrate to show out the front. The meters on my old FT107 line all had small bulbs mounted in the meter face itself below the coil. Not much room in the AT230 for that.

I have a 520SE I bought a couple weeks ago. Good looking old radio, clean and free of crud on the chassis. Tuned and loaded it up last evening on 75 meters, the output was low, I switched it to CW position, repeaked the drive, dipped the plate, and saw the output gradually come up. Within a second or two it popped and went dark. There was a zzzttttt noise under the chassis. (How do you like that for a description) I haven't went any farther, suspect it took the fuse, and some resistors under the finals went south. I hope thats all it was. Anyway, I'll give it a look this evening. Now I have a project radio. As long as the 530S works I'm in no hurry.

We have a Yahoo Group called KenwoodQSO. Ellen has tried to establish a regular net but we are at the low part of the sunspot cycle and it is difficult to have success. However she hasn't given up yet.

We also use the group to announce that we are on and on what frequency. We have had some success with this and I believe as we get into winter conditions and get more members we will do better. As habits form, people will know when to check the reflector.

I looked at the Inrad site, and your radio takes the same YK-88C cw filter mine does for my TS-530. I watched 3 of them go on Ebay, prices ranged from $58 to $90. I missed bidding on the first, was overbid on the second, and by that time the 3rd was over my limit, too close to Inrads price. It seems that they are in demand, and I may have to order from Inrad.

Good luck!

Hi Guys,

The Kenwood cw filter for the 820(S) is the YG-88C as Joe said. The Inrad filter has exactly the same pin configuration as the YG series and will drop right in the 820(S) . Ed, for your 530S, the Inrad filters are much larger in size than the YK-88C(N) filters and you will have to wire in the Inrad 8.83 filter with RG-174. The 455khz filters are the same though. The Inrad filters are much better than the Kenwood YK series.

6 Mos ago I had a very nice TenTec Omni V with a bunch of filters. I had the TT 250 and 500 Hz filters as well as the Inrad 400 Hz filter. I was able to do a lot of A/B comparisons between the filters as I decided which ones to keep and which to sell.

The Inrad filter had much steeper skirts and a tighter passband, but it did NOT have as much ultimate rejection. I'd hear strong carriers (40 M BCI) for many KC as I tuned past them. The TT filters weren't as sharp but their stop band was much more convincing. I kept the TT filters and sold the Inrad filters.

Then I got a K2 and sold the Omni V radio.

Now, to be sure, I've never done that same test using Inrad and Kenwood filters so my results may be rather meaningless. Still, my experience taught me that "Inrad" does not automatically mean the filter is superior in all aspects.

I also had a stock 830s at the time. The Omni V with stock TT SSB filters was much sharper and more DX-sounding than the 830s. I put wide Inrad SSB filters in the Omni (Veeery nice!) and the Omni rivaled the 830s for SSB sound quality. Omni still had more IF noise though.

9623. Filter mod for the TS830

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-09-27 13:09:38 UTC
From: max_ve3tmt
Topic: 9623 Message: 9623

I performed the filter mod on my 830 last night which allows me to use the 500 hz CW filter in any mode. My main reason for doing such was for PSK and RTTY work. It is worth doing. It reduces the QRM to next to nothing and with the IF SHIFT and VBT features, I swear it performs better than my 850 did. I rewired the VOX switch to activate the filter but I think tonight I will change it over to the NB switch and just hardwire the NB on. I use it most of the time at my QTH anyway.

I look forward to reading it Walt. I was going to say the same thing for the 830 would be helpful, but I decided to feed the audio directly into the balanced modulator bypassing all those restrictive mic stages.

73,
Max VE3TMT

Hey Max,

I have not looked at the switch itself but could you use the DH switch? I for one don't use that too much...as in never.

Unless the Italian 830's are different the power transformer doesn't
have the taps for the DS-2. The 830's are AC only.

Well, good point!!
Do you mean that only the "W type" has the taps for the DS-2?
Mine is a regular 830M, but I was absolutely convinced it has the
possibility to add the DC-AC converter.
On the other hand, "W type" means Europe, therefore it should be ready.
It's matter to verify if a "M type" is also a "W type".
I've to check it internally on the transformer.

Thanks again

I don't see why it wouldn't work Rick. All the DH switch does is
ground pin 1 on connector # 1 on the counter board. It is an SPDT
switch, the third terminal is unused. Mod is very simple..

Turn the 830 over and locate on the mode switch, the white wire with
the blue stripe. Unsolder this wire and relocate it to the common
terminal of whatever switch you chose to use. One outside leg of the
switch goes back to the mode switch, where you removed the white wire
from, and the other outside leg of the switch goes to the terminal
where the green wire selection for your CW filter goes, in my case peg
2.

Thats all there is to it. I ran some experiments on PSK last night on
40m and the difference in readability was incredible. Now you have me
wondering which switch to use!!

9630. Audio Hum through monitor when operating PTT

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-09-27 20:47:06 UTC
From: nigel4416
Topic: 9630 Message: 9630

Hi all
I have been using my TS-820 for several months with no problems. I have always operated the rig with the monitor circuit switched in with only my quiet clean voice comming out of the speaker when speaking into the fist mic. Yesterday I tuned the radio up and pressed the PTT on the mic to call CQ and experianced an audio hum comming out of the speaker along with my voice at the correct level. This hum gets worse when the coiled mic lead is grabbed and dissapears when a finger and thumb is placed around the mic plug on the front of the rig. I think it has something to do with earthing but don't know what. Would it have anything to do with a fault with my RF earth? (my RF earth is buried underground but has recently had tractors driving over this ground - so I am fearing a damaged earth) . I took the fist mic and the mic plug apart but found no loose or broken wires. Can anyone help and give me some ideas as to why this problem has just showed itself and what I can do about it. As far as I am aware I have not changed my setup in any way to cause this fault, it just started happening. I fear that if I am hearing this hum on the monitor circuit then perhaps this hum is being transmitted as well. The hum is like the sound you get when touching the input on an audio amp.
Thanks
Nigel M1EQA

What is your earth? and what is the antenna? I was wondering this for RF on the mic. second check the rig over for soiled connections or bad solder joints.

1. Verify it's actually there and not in the monitor circuit by an on
the air contact. Make contact and then pinch the wire where the hum
goes away, What does the other person hear??? Same, no change, etc...

2. If it's actually there and goes away with the "pinching" then you
may have a broken ground wire in the mike cable. Ohm out the mike
cable and wiggle it around while checking. Pin 4 is the audio ground.

3. If the hum is there then unplug the mike and key it with the PTT.
Is the hum still there? If not, mike cable. If so then time to dig deeper.

Clif

9636. [TS-520_820_530_830] Audio Hum through monitor when operating PTT

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-09-28 07:10:00 UTC
From: Richard Harris
Topic: 9630 Message: 9636

Nigel,

It may well be caused by earthing, but perhaps mains earth leakage, rather than RF pick-up. From the Service Maual schematics, the 820 does not have a connection to mains earth through the mains cord. When you touch the mic connector do you get any sign of any leakage, for example any tingling in your finger or does the smooth surface of the connetor feel "rough" (I can't think of a better decription but I have observed that small leakage currents can make a smooth conductive surface feel strange)? Does the sound that you get from the speaker sound like 50Hz of 100Hz? The former would be indicative of leakage, the latter would indicate a smoothing problem in the power supply. Have you had any reports of mains hum on your SSB transmissions?

From what you write, you are using an external earth. Can you tell us some more about how this is done?

Finally, as far as "earthing" the rig is concerned, read the warnings in the RSGB Handbook and recent correspondance in Rad Com - external earthing can be hazardous if your house is wired to modern standards and a Neutral fault occurs. I have to admit to using mains earth as my RF earth to avoid this particular hazard - no TVI complaints as yet!

Richard G3OTK

Nigel:

I would very strongly bet that the mike has developed a problem in the shield. I would also bet that it is really transmitting the hum.

What mike are you using? If it is an MC-60 the plot thickens.

If it is an MC-50 or 60, connect the mike direct eliminating the stand.

Assuming that it is not one of those, unplug the mike and operate the send switch on the rig. Do you hear the hum?
I would guess not.

I am also assuming that nothing is connected to the phone patch jack on the back.

Now, if the above is correct,

On the TS-820 pin 1 on the mike plug is the live audio. Pin 4 is the audio shield ground.
Pin 2 is the live PTT line and Pin 3 is the PTT ground. These grounds are different from each other and different from the rig chassis ground even though they will appear to be the same with an ohm meter.

Sometimes the two grounds are connected together in the mike and that is OK. However, if the shield ground opens up somewhere, the mike will still work but can get a hum.

In the mike plug at the rig end, temporarly disconnect the wires from pins 2 and 3. Key the mike and key the radio by operating the send switch. Do you hear the microphone audio ? If not, the shield line is open. If you do, do you still get the hum?

Another test would be to use another mike plug and connect a couple feet of coax to it. Center to pin 1 and shield to pin 4. Place a 10 K resistor across the other end of the coax. Key the rig with the send switch. Do you get the hum ?

Of course, if you have another mike, you could wire it for your rig and try it.

If any of the wires in the mike plug touch the mike plug shell, it can cause problems even it it is the shield wire that is touching.

BTW, shields can and often do break inside the cord. One common place it at the strain relief on the plug. If there is a plug at both ends, it can happen at either end. If the cord is fast to the mike, it can break where it

comes out of the mike.

You can disconnect the shield from the plug, remove the plug from the radio and check the shield for continuity with an ohm meter. Flex the cord around as you do this.

Try these things and let us know what you observed.

Vy 73, Walt N9WB

Thought about that Walt, but I hear enough relays with this thing. The switch seems to be working pretty good. After our chat last night I readjusted the trimmers to bring the low end down a bit. We will have to do an on the air comparison.

9641. KA2HHB TS830S Update

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-09-28 13:21:26 UTC
From: Ruben Echevarria
Topic: 9641 Message: 9641

Hello friends.... After pulling my RF board and replacing L36, C71, and C74 I still have no ALC.
I'm getting RF output of about 80 Watts although I don't know how reliable my meter is. I'm using
the meter and dummy load built into my MFJ989C tuner. The only positive outcome was getting my
receive to come back up to par as compared to my other working TS830S. Thats was the plug on the
IF board that was loose. Both boards have been resoldered. I've also replaced the drivers and finals
several times with the same results. Relay has been cleaned as well. I guess that's about as far as I can go
with this rig. I'm going to have to ship it out. IP is good and fully adjustable as well. But when I switch
over to ALC I get no swing at all from the meter. I switch the meter to RF and speak into the mic and
get a light swing on the meter, but not very pronounced. Tune up in CW mode and get 3/4 scale ouput on
the meter. By the way I noticed a difference between the lighting on the meters between the so called
'Gold' and 'Silver' models. The 'Gold' has a single bulb illuminating the meters where the 'Silver' has dual
bulbs illuminating the meter. Just and observation. Many thanks and any comments would be appreciated.
Thanks...Ruben KA2HHB

Sounds great Walt - thanks for this!

I used to be of the opinion that SSB HAD to sound dreadful. Then, after getting my license and hearing some hams on SSB on 20M [my hangout - I only have a 20M dipole for space reasons] with really great sound, I got sort of bitten by the idea of high quality SSB. Needless to say, with high quality sounding amateur radio, it becomes more appealing in today's internet world, as HQ Amateur Radio goes beyond bare voice communication. When it sounds like you are chatting in the same room, Amateur Radio is very appealing.

I'm not sure whether my Kenwood TS-520SE will become my HQ SSB rig, or my Drake TR-4 [when I get it up and running]. Or perhaps both?

9643. 520 or 830 series?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-09-28 14:26:37 UTC
From: Jody Mills
Topic: 9643 Message: 9643

I currently have a non-working 520s that I've been meaning to send in for professional restoration. I now have an opportunity to purchase a working 830s for a few hundred bucks. I would like to create a Kenwood-only "vintage" station with any accessory equipment that was manufactured to go with a specific transceiver. My quandary is this: Which way should I go--the 830 series or the 520 series? Do both transceivers have accessory lines (antenna tuners, station monitors, etc.)? Is one series easier to find accessories for than another?

I only have enough funds to go with one station setup, so I want to make the smartest choice here.

Thanks!

Hello All,

The European and Asian 830S' have a 12 pin cinch jones type connector on the rear of the radio for power and with a DS-2 installed, they will run off 13.8VDC. In fact, they look a lot like an 820 from the rear. Internally, they are identical with the exception of the power transformer. I have some photos of my European model in the photos section.

Dom, I doubt there are very many DS-2's here in the States. I do see them from time to time on E-Bay though.

9645. Noisy 830s VFO Knob - recommendations?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-09-28 14:52:33 UTC
From: Darwin, Keith
Topic: 9645 Message: 9645

My 830s is a nice rig but ... the VFO knob makes noise. Apparently the lead balls epoxies inside the knob for weight are loose and make a bit of a noise as they shift around while turning the VOW. Can I fix this easily? Should I just get a different knob? Should I hold out for one of the fancy weighted knobs that are so hard to find?

Anyone have a knob they want to part with?

Hi Keith,
I have used the 'syringe' style epoxy dispensers that mix the resin and hardener as you depress the plunger. Works well in tight spots like the inside/rear of your VFO knob. I used the weighted, rubber ringed VFO knobs off of a 930S for both my 830S and VFO-230. They work fine and look good. There are lots of 930S' and 940S' being parted out on qth.com and E-Bay..Paid $25.00 for these. Much less expensive and look better than the purple hued QB-1.

Topic: 9643 Message: 9647

This is largely subjective. Both lines have a full line of matching goodies. The 830 will do more and can be easily modded to do WARC bands. The 520s line is mighty cool and will cost you half as much as the 830 line BUT the 520s line only does old school bands and is not as feature rich as the 830s line. Both are fairly easy to find accessories, though it seems a little tough to find a good digital display for the 520.

If money is not too much of an issue go 830. That said a full 520s shack would suit me just fine.

Funny that tranceivers are now being considered vintage. I remember operating my dad's DX-100 and 75A4 and wishing we could get a new 820s.

Best regards,

Sean

I can only speak to my own station, which is a TS-830S.
I have with it:

SM-220 Station Monitor Scope
VFO-230 Digital External VFO
SP-230 Speaker

I'm currently looking for an AT-230 Antenna Tuner

Once I get the AT-230, I'll be finished. The setup
all matches, except for the SM, which is a little
taller and the others. All color-coordinated, etc.,
and the XYL seems to appreciate that it looks
so good.

My previous rig, which I still have, is a
Heathkit SB-102 that I built myself in 1969, and
it has the matching station console and
speaker.

Just my thoughts. YTMV

9650. VFO 230 vs 240 for 830s?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-09-28 15:49:47 UTC
From: Darwin, Keith
Topic: 9650 Message: 9650

I've assumed the VF0 230 would degrade RX performance in the 830s since it is a synthesized VFO and would create problems with synthesizer noise that the regular VFO doesn't create. If I'm right, won't the VFO 240 be a better choice for top-notch receiver performance?

Hello,

One thing to try with the LED's is to sand a flat spot in them. You can diffuse the light over a bigger area. You can customize how you want (direction and width) the light diffused. Take a look at the link below, the led info is towards the end.

http://www.collinsra.com/cra_album/0410_12/cra_0410_12.html

I have used LED's from everything from SX-25's to R-390A's.

Best,
DW Holtman

Topic: 9643 Message: 9653

By nothing more than chance, I happen to have the TS830S. I had been looking for a 520, figuring that I'd never come across a TS-830S, and then I literally have one fall in my lap.

Having said that, I probably would have been just as happy to have obtained a 520 if that opportunity had come first.

The 830S continues to be my best radio owned to date, and that includes a few new HF transceivers. It does have a lot more features than the 520, the WARC bands in particular are nice.

IMHO, if you have the opportunity to obtain a working 830S, take it, especially if you have the funds. If a 520 is all you can afford, you will not be disappointed with that rig either. The 830 is simply a higher end radio.

As Ken points out, tne fun part of either of these stations is the challenge to obtain all of the "complete station" components, such as the monitor scope, speaker etc...

Nothing like owning/collecting a classic radio that has performance at least equal to, if not rivaling in some aspects, current technology!

73,
Bob - KA9FLX

Excellent information. I will have to give it a try. Just one more reason to take the cover off! Hey Walt, if you can identify that trimmer for me I'll give it a try too! Now you got me thinking I've adjusted the trimmers too far, but I think it sounds pretty could, just a slight more bit of lows. If I bring it up it starts to sound tinny.

AADE makes a plug and play display specifically for the TS-520S/SE. I have one, with the optional blue two line display, and it is fantastic. One line is my callsign and first name, the other is the frequency.

BUT - I had to tweak it myself - the holes for the RCA jacks on the back were not big enough to allow good contact with a wide variety of RCA plugs. I took out the PC boards, drilled the holes bigger, re-installed using deoxit on the plug in strip and the jacks. Works 100% perfect now.

9660. 520 or 830 series?

The TS 520 is a very basic rig that is built like a Sherman tank. It is a very good rig that performs well. It is relatively easy to service.
The TS 830 is one of the finest rigs from a technically design standpoint ever made. But it has some mechanical deficiencies compared to the TS-520.

This said, it is still relatively easy to work on compared to today's current rigs. The problems with the TS 830 are as follows:
The bandswitch was of an era that contacts were installed with rivets. The dissimilar materials caused these to become intermittent. If you are any good at component level repair, this can be presently fixed by soldering the rivets to the contacts and the foil on the switch wafers and if done properly, the failure will never occur again. The other problem is that after 25 years or so the shaft couplings on the bandswitch shaft break. These couplings can be replaced.

The third danger with the TS 830 is that you are likely to find that it is superior to your new $2500.00 to $14,000 rig and you will suffer from disillusionment of your modern rig.

The TS-520 is a wonderful rugged rig.
The TS 820 is a slightly more advanced rig with a digital readout.
The TS 530 is about the same as the 820 with Warc bands.
The TS 830 is one of the highest performance analogue rigs ever built.

I currently have a TS 820 that I will never part with.
But some day I am also going to have a TS-830.
I recommend the TS-830. Then fix the 520 too !

Subject: [TS-520_820_530_830] 520 or 830 series?

I currently have a non-working 520s that I've been meaning to send in
for professional restoration. I now have an opportunity to purchase a
working 830s for a few hundred bucks. I would like to create a
Kenwood-only "vintage" station with any accessory equipment that was
manufactured to go with a specific transceiver. My quandary is this:
Which way should I go--the 830 series or the 520 series? Do both
transceivers have accessory lines (antenna tuners, station monitors,
etc.)? Is one series easier to find accessories for than another?

I only have enough funds to go with one station setup, so I want to
make the smartest choice here.

Thanks!

9662. VFO 230 vs 240 for 830s?

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-09-29 12:32:38 UTC
From: Darwin, Keith
Topic: 9650 Message: 9662

I've assumed the VF0 230 would degrade RX performance in the 830s since it is a synthesized VFO and would create problems with synthesizer noise that the regular VFO doesn't create. If I'm right, won't the VFO 240 be a better choice for top-notch receiver performance ?

What's the general consensus about which VFO to use with the 830s? There are clearly a lot more 230s than 240s.

Once you get around the problems you expect from a 20+ year old radio,
the 830 is great. Easy to work on, no SMD components and easy to mod!!

9664. Peripheral equipment for the 520s?

Yahoo group: TS-520_820_530_830 (2006)

From: Jody Mills
Topic: 9664 Message: 9664

Thanks for the replies on my previous question regarding the 520 vs. the 830 series. Due to the fact that the 830 I was looking at on ebay is now up to $500 and will likely sell for at least $600 at auction end, it is no longer an economical purchase for me. Just for price comparison, a brand new Icom IC-718 "beginner" rig goes for $600 at HRO! I originally purchased the 520 on ebay for $120 (knowing it was non-working) and figure I'll pay around $300 for refurbishing, which is still considerably less than what I would pay for a brand new transceiver of any brand.

Now I am interested in finding out what peripheral equipment Kenwood manufactured for use with the 520 series of transceiver and their model numbers. I'll need to know this when I go searching on ebay again...

Thanks again!

Jody

E-Bay - it pays to know what you're doing. 830s Rigs seem to go for about $300 with no CW filters and something like $400 with both CW filters. There is some variability of course. My current 830s I got with 2 CW filters for $375 BIN. The one I had 8 mos ago I got for $290 (IIRC) with no filters and sold it for more than that. Sometimes people bid way too much for an item. Sometimes the bidding ends at a surprisingly low number (often when I sell things). If you're reasonable with your expectations and patient enough to wait for a good deal, you can usually get what you want at a price that is fair. Fair means a price that you could get if you were to resell the rig in a month or two, not necessarily what you were expecting the thing to cost or what it's worth to you.

Your 520 at $120 plus $300 for refurbishing comes up to be $420 which is more than most 830s rigs would cost. True, the 520 would be refurbished for that price but most $350 830's are in very useable condition making professional refurbishing a nice-to-have rather than a must-have.

The topper...

I traded away my TS850S for the 830 lineup I have now and honestly I
can say I am having more fun with it than I ever had with the 850.
Sure the 850 is solid state, no-tune, memories and such but I can do
everything on the 830 I did with the 850, except true FSK keying and
no PC control. But I don't miss those features. If I was a heavy
contestor, obviously I woudn't be using a tube final rig, but for
casual operating the 830 is a great radio, the receiver is super quiet
and it sounds better than my 850 ever did. I repainted all the cases
to the same color Kenwood uses on the current rigs and it looks very
nice on the desk. You can see the staion on QRZ.com.

Yes I agree, An external inverter is an excellent idea for use. The 830 uses up to I think 295 watts total at standard 120. I once bought an inverter for this at a truck stop intending to make a tank circuit to clean the AC to a sinewave. Never finished the project but my inverter is in someone elses truck for thier TV and laptop right now.

They can be purchased for as little as US$ 100 and can be found in not just truck stops but automotive stores, Northern Tool catalogs, and even the web pages, just run a search engine for inverters.

My idea is to someday buid a DC back up and have several batteries to the inverter, and maybe attach an poer supply for charging and solar cells. Then I can have just the Linear to power from 220.

It can allow the flexibility for other 12 volt items too. Then just about anything of smaller draw can join the power supply. Like a VFO-230. You can even go to mobile and portable to some degree. What would field day be like with your 830? It adds flexibility to your station even off the grid to some extent.

I'd suggest to choose which radio you prefer to us and set that up for now and see how you fell and think about it down the road. You already are familiar with the 520, see how you feel overall with the 830. I have an 830 now and my elmer had the 520SE. I've seen both. My preference is the 830 for me.

When I bought my first 830 back in the early 80's I was familiar with the 520 from Dale. I dreamed of a 920 but no way to fund it. As it was it took me 2 weeks vacation pay and all the savings I could muster at the time. Boy what a rough year. Anyways, that got me thru 25 years of off and on air time dabbling from all sorts of locations. now I have my second 830 as my first gets used by Dale as we try to get it up and running again.

Find out which one you like to operate primary and set the other up as backup. That's my suggestion. Both may share some common accessories as far as hookups go. But you can only use one at a time.

Keith,

I haven't had experience with either the VFO 230 or 240. The other possibility, if you're not stuck with wanting an exact style match, is the VFO-120. It is rarely mentioned but the 120 works fine with the 830S. Most seem to sell for under $100. In fact, there was one on QTH.COM a week or so ago for $55.

For purely selfish reasons, on my part, I say go with the 830 series. I'm trying to build out a complete 520 station, and there is already too much competition for the accessories. :) All I have left to get, I think, is the AT-200, PC-1, and TV-502. I currently have a 520SE (under modification at this time to connect the transverters), TV-506, SP-520, VFO-520S, DG-5 and an Astatic D-100 "Black Eagle" mic.

Have fun building and operating your station.

John: The WD8IEL, Chelsea, Michigan ARC has used a TS520s for the last three years on field day. We use gasoline powered generators and the rig perks along just fine. It is mostly used on 40 SSB. I must admit I take my TS940 to field day, I am the CW opt and constiently cruising the bands for contacts rather than staying fixed. Next year how ever I am going to take a TS530 instead of the TS940 and try staying on one band calling. And yes, I use a J-38 key to keep up with the times. I am looking forward to that. KG7FS

Topic: 9643 Message: 9672

Over the years I've had the pleasure of owning and operating a 520SE with the DG-1 digital display, 530S with remote VFO and an 820S also with remote VFO plus the SM-220 display. All 3 radios are, in my opinion, excellent transceivers. It just so happens my 820S is down hard with receive problems, a shame since I really like the 820S.

I no longer own the 520SE or 530S. Since I have never owned or operated an 830S, I can not comment on it but I'm sure it's as good as folks here have said it is.

Simply put, the Kenwood 520, 520S, 520SE, 530S and 820S are excellent transceivers. All of them are rugged, easy to use and, based on each model, have all the necessary features for ham use.

In closing, I find simplicity works best for me. I would take a 520, 530, 820 and 830 over any of the new radios today! They simply do the job and do it right without all those rediculous menus and features that most hams would, more than likely, never use! Therefore, if you have the opportunity to pick up a good 520, 530, 820 or 830, take it, you will not be disappointed.

73's,

Mike

I would suggest you take the 520 as a restoration learning project. Don't be intimidated by one. I never was, I have made a few radios much worse before I got them better. Don't be afraid to ask for help here. I know there are lots of folks on here that are very knowledgeable about these radios. The best way I know of to learn is by doing. Just remember you are not in this alone, and also remember these old transceivers will bite you too. They have unfriendly voltage in there, so keep one hand behind you. But go for it, most of the time my theory is I have nothing to lose, its dead anyway.

Mike, without beating this subject to death, the thing I appreciate most about the old Kenwoods is I can change bands, etc. and not have to get out a manual to see what went wrong. I can piddle with my FT857d, which is a nice little radio, but without a manual, I get it off in the weeds. Give me the knobs anytime, I'm too old to remember menus. Much like a new GPS I have, I might as well have a left seat in the space shuttle, either would be about as foreign. Doesnt do any good to try to remember how to use it, next time its all new. Just too old for new fangled toys I guess.

I've owned an 830 and a VFO-230 for 25 years and never experienced a
degrading of receiver performance.

Hi Jody,

I've used both the 520S, and the 830S. Both are good radios in my opinion. Ifyou only have one radio, and insist upon WARC band coverage, go with the 830S. I used one at W9YT (the Univ. of WI Ham club), and it was great. I briefly had a TS-520S, and 9it was a good radio. I have a TS-820, and it's a good radio. I has no WARC bands capability, but i think it has character. Go with your gut feelings. They're all good radios.

73,
Ellen - AF9J

VFO 230 not synthesized? I hadn't even considered that. I figured if it had memory, it had to be synth. Maybe not though.

To the best of my knowledge the VF0 230 is not synthesized. It's the last if not one of the last analog vfo's from Kenwood.

From: baumbrent
Topic: 9679 Message: 9679

I opened up my 520SE to replace the 11m crystals with the proper crystals for 10m. It appears to me that the easiest way to do it, because the Osc/Crystal board is at the front of the pack, is to remove the entire Oscillator/coil unit from the radio. I can then replace the crystals without having to remove/unsolder the board from the chassis. However, the selector shaft and wafer board rods run through this whole assembly as well.

My questions are is there a better way to replace the crystals? Is there a best method for removing the mode selector shaft and wafer board rods?

Thanks,
Brent, K7MEI

The VFO-230 IS synthesized. The VFO-240 is analog. They were the last
remote VFO's built. The radios after the 830 were synthesized and have
dual VFO's built in.

Another option is the DFC-230, a digital frequency controller which is very compact, allows the use of an up/down microphone and also has 4 memories (if memory serves). I have a couple and paid about $70 for each of them. They are also great with a TS-120 or TS-130S for mobile or portable service.

Keith,

I haven't had experience with either the VFO 230 or 240. The other possibility, if you're not stuck with wanting an exact style match, is the VFO-120. It is rarely mentioned but the 120 works fine with the 830S. Most seem to sell for under $100. In fact, there was one on QTH.COM a week or so ago for $55.

Another alternative is the dfc-230. It works great with the TS830 also.

Before giving up on the 830, try qth.com. You may find one for around $400. 73, Jim K4AXF

Subject: [TS-520_820_530_830] Peripheral equipment for the 520s?

Thanks for the replies on my previous question regarding the 520 vs. the
830 series. Due to the fact that the 830 I was looking at on ebay is
now up to $500 and will likely sell for at least $600 at auction end, it
is no longer an economical purchase for me. Just for price comparison,
a brand new Icom IC-718 "beginner" rig goes for $600 at HRO! I
originally purchased the 520 on ebay for $120 (knowing it was
non-working) and figure I'll pay around $300 for refurbishing, which is
still considerably less than what I would pay for a brand new
transceiver of any brand.

Now I am interested in finding out what peripheral equipment Kenwood
manufactured for use with the 520 series of transceiver and their model
numbers. I'll need to know this when I go searching on ebay again...

Thanks again!

Jody

Jody,
Look at my previous post where I teased you about the competition for 520 peripherals. I think I listed all of them at that time.

Anyway here goes to the best of my knowledge: TS-520(s)(se) transceiver, SP-520 speaker, VFO-520(s) external VFO, DG-5 digital frequency display, TV-502 2 meter transverter, TV-506 6 meter transverter, PC-1(a) phone patch, MC-50 or MC-60 microphone, AT-200 antenna tuner. The SM-220 station monitor scope really doesn't match the appearance of the 520 line, but it fits in.

Anything else, group members?

Have fun building your station. Please don't out bid me on e-bay. :)

Brent, K7MEI

9685. TS830 Problem

Yahoo group: TS-520_820_530_830 (2006)
Date: 2006-09-29 21:36:38 UTC
From: Jim Stoneback
Topic: 9685 Message: 9685

One last try before I ship it to a repair shop. Has anyone fixed this problem before?

My TS830s has no sidetone, thus no semi-QSK CW.

With MON switch on, key depressed, there is no sine wave at TP1, no qsk, no CW output.

I injected a tone at TP1 and get sidetone, semi-qsk action and CW output.

I checked all the components in the sidetone circuit with no bad components found; replaced transistor and zener anyway, to no avail. My confidence is shaken. Help!
